With the exception of E. P. Thompson’s work in labor history, cultural studies’ impact on historians was more measured and slower to appear in American scholarship. As the historian Michael Denning (Cohen, 2007) recollected of his return to New York City in the early 1980s, after pursuing graduate work with Hall at the Birmingham Centre for Contemporary Cultural Studies, “at that point, cultural studies was not visible in the US” (p. 7). Within a few years, Williams’s and Hall’s influence began to show. Perhaps the best early example was Roy Rosenzweig’s *Eight Hours for What We Will* (1983) – a community study of class dynamics in Worcester, Massachusetts. Rosenzweig’s study drew on an archive that would have been familiar to social historians: community newspapers, city directories, local histories, and reports issued by various labor boards, government bureaus, and social reform groups. What set Rosenzweig’s study apart from other labor community studies was that it shifted the focus of analysis from the factory and union hall to the saloons and newly built playgrounds, amusement parks, and movie houses of the industrial city, showing how they served as sites of resistance and eventual capitulation to industrial capital. Rosenzweig was particularly influenced by Raymond Williams’s model of dominant, residual, alternative, and oppositional cultures. According to Rosenzweig’s analysis, the saloon and grog shop were alternative spaces, or sites that fostered a unique, working-class way of life, different in significant ways from bourgeois norms and values, but nevertheless coexistent with them. Worcester elites, on the other hand, mistook such places for opposition and thus sought to reform or eradicate them. Class, leisure, and the new mass culture remained a popular topic among historians and by the early 1990s Robin D. G. Kelley (1992) could point to more than a dozen recent works that employed a cultural studies-inspired framework of contested terrains.

Turn 3: Discourse and Identity

Kelley’s research, which focused on African American working-class culture, can be seen as transitional. Before the early 1990s, cultural studies was used as a way to

better understand class; afterward it was just as often used to understand race, gender, and sexuality. Kelley's (1994) analysis of Malcolm X's dalliance with zoot suit culture in the 1940s, for instance, moved effortlessly back and forth between issues of blackness, masculinity, heteronormativity, and working-class identity. The shift in historiography was tied to changes in cultural studies itself as the discipline expanded its scope around 1980 to more directly engage with feminist theory and issues of race and empire (Hall, 1980). The field's broadening of horizons in part reflected its commitment to political intervention. But just as important was the growing influence of poststructural theory. Whereas structuralism emphasized the deep structures – generally understood to be conceptual binaries – that governed the mechanics of meaning making, poststructuralists argued that those binaries were themselves linguistic constructions. So for instance, Stuart Hall's (1981) essay "Notes on Deconstructing 'the Popular'" not only emphasized the contested nature of popular culture, but also sought to problematize the category "popular" by showing its constructed and political nature. Viewed this way, the "popular" wasn't a fixed quality inherent in certain texts, but a "structuring principle" that divided "what, at any time, counts as an elite cultural activity or form, and what does not" (p. 234). Taking the full measure of poststructuralism's influence is beyond the scope of this essay, but its biggest impact on cultural history was that it shifted scholars' attention toward classificatory schema that produced impressions of difference and the processes by which those schema's boundaries were policed. Kelley (1992, p. 1402) for instance drew heavily on Hall's "Notes" (1981) to argue that taken-for-granted cultural binaries, such as high/low or folk/mass, must always be seen as "socially constructed categories that have something to do with the reproduction of race, class, and gender hierarchies."

Simultaneous and closely related to these developments in cultural studies was the growing influence of postmodern thought on a number of influential feminist historians. The signal event in this case was the publication of Joan Wallach Scott's (1986) "Gender: A Useful Category of Historical Analysis." In this explosive, if modestly titled, essay Scott urged historians to understand gender as not only a socially constructed set of norms and product of patriarchy, but as a discourse, or system of thought, that enabled power to be exercised across the entirety of social experience. In developing this argument, Scott drew heavily on literary criticism and feminist film studies, both of which had been overhauled in recent years by the poststructural thought of Michel Foucault, Jacques Derrida, and Jacques Lacan.

Scott's argument was heavily influenced by Foucault's theories of discourse and power, and in this regard it marked a turning point in how historians appropriated the French philosopher's ideas. Though Foucault's sprawling intellectual histories of the mid- to late 1960s attracted admirers across the humanities, historians largely ignored this body of work. Rather, Foucault's initial wave of influence in history departments grew out of his mid-1970s work on prisons and sexuality, which in turn led to the rediscovery of his earlier work on hospitals and asylums (Megill, 1987). This Foucault fit well with the aims of social history because he offered new ways

to approach the study of stigmatized populations – criminals, the mentally ill, sexual nonconformists, and others. Scott's essay, on the other hand, signaled a new engagement with Foucauldian thought as a theory of culture. Though professional historians did not always look kindly upon his unorthodox methods, Foucault (1971/2010) saw historical inquiry, or what he called "genealogical" (p. 232) study, as at the center of his scholarly enterprise. From the "genealogical" perspective, the history of culture was the history of discourse formation, which could be traced by following the "conditions of appearance, growth, and variation" (p. 234) by which systems of knowledge were endowed with "the power of affirmation" (p. 234), or the authority to speak truth. This Foucault allowed historians to think about the ways that power flowed through bodies of knowledge and everyday conversations to eventually harden into institutionalized forms of authority and internalized modes of subjectivity. Equipped with such a perspective, Scott (1991, p. 779) argued, historians could get at complex processes of identity formation "that, through discourse, position subjects and produce their experience."

The shift toward questions of discourse and identity represented a kind of second phase of the cultural turn that Nan Enstad (2008, p. 321) has described as the shift from a "visionary cultural history of subalterns" to a "deconstructive cultural history of categories and hierarchies." In the former, historians appropriated the tools of anthropologists and folklorists to recover the social experience of downtrodden and marginalized peoples. In the latter they turned to poststructuralism and literary deconstruction to denaturalize and thus foreground the contingent nature of categorical differences and the social inequalities they buttressed.

Gail Bederman's *Manliness and Civilization* (1995) provides an early, influential, and especially direct example of this new approach. The study explored changing conceptions of US masculinity and race at the turn of the twentieth century, but it did so by providing a genealogical account of the discourse of "civilization." "The interesting thing about 'civilization' is not what was meant by the term," Bederman explains, "but the multiple ways it was used to legitimize different sorts of claims to power" (p. 23). In particular, "civilization" provided a means to reconcile "manliness," the male gender ideal of Anglo-American bourgeois culture, with "masculinity," the hot-tempered ways of being male that elites associated with immigrants and African Americans. Out of this discursive tumult came the figure of the modern man, refined enough to lead "civilization's" charge, but yet "savage" enough, when need be, to defend it from barbarism. Thus the focus of Bederman's study was a constellation of ideas – civilization, savagery, manliness, masculinity, whiteness, and blackness – that in their dominant formation conferred enormous social power. Her method of tracing its "appearance, growth, and variation" (Foucault, 1971/2010, p. 234) was to re-examine an eclectic, but well-known, cast of figures: boxer Jack Johnson, muckraker Ida B. Wells, psychologist G. Stanley Hall, feminist Charlotte Perkins Gilman, President Theodore Roosevelt, and novelist Edgar Rice Burroughs. To do so, Bederman relied on a fairly conventional archive of the memoirs, published writings, and letters of her subjects, coupled with contemporary newspapers, magazines, and

nonfiction works. Much was already known about the figures Bederman studied. What wasn't known was how their thoughts and actions converged in unexpected ways to produce a powerful form of white male subjectivity in twentieth-century America.

Grace Elizabeth Hale's *Making Whiteness* (1998) provides another illustrative example of scholarship shaped by the turn toward discourse and identity. Hale's study of segregationist culture explored the racist discourses and rituals that surrounded the production of whiteness as a mode of identity in the Jim Crow South. As Hale demonstrates in her analysis of phenomena ranging from children's literature to national advertising and public lynchings, Jim Crow was not a holdover from antebellum culture, but a distinctly modern and wide-ranging project to brutally maintain the racial boundaries that White southerners feared were disappearing in the wake of Reconstruction. In keeping with the sweeping nature of the study, Hale drew on an astounding mix of sources that ranged from children's books to the lynching case files of the National Association for the Advancement of Colored People (NAACP).

The growing interest in discourse and identity formation, especially with regard to race, also motivated historians to look at empire in new ways. Although historians of Europe and the ancient world had long made imperial expansion a major object of study, practitioners of the new social and cultural history had largely overlooked these questions. By the early 1990s, the growing influence of postcolonial theory and subaltern studies, coupled with the weight of globalization as both a lived phenomenon and a thriving area of research, spurred scholars to look again. When they did, empire began to turn up everywhere from Wild West shows to middle-class cupboards (Eley, 2005).

As was the case with gender, the conceptual breakthrough came from thinking about empire outside the bounds of its traditional usage and seeing it instead as a far-reaching discourse. "Not only about foreign diplomacy or international relations," literary critic Amy Kaplan argued in 1993, "imperialism is also about consolidating domestic cultures and negotiating intranational relations" (p. 14). Framed as such, empire offered a means of thinking about interethnic and interracial contact as it played out in various ways across the social and imaginative landscapes. On the one hand, imperialism provided the homegrown bodies of knowledge and stocks of symbolism through which Westerners imagined the foreign (Said, 1979). But also, these "imaginative geographies" (p. 49) could be projected onto the home environment to mark qualities of difference, exoticness, and danger. Historian Melani McAlister's (2001) analysis of the Middle East in postwar American culture offers a good example of the new thinking about empire. Drawing almost entirely on popular sources, *Epic Encounters* shows how US cultural productions ranging from *The Ten Commandments* (1956) to the traveling *Treasures of Tutankhamun* exhibition (1977–1979) provided ordinary Americans with frameworks with which to make sense of a faraway place that, thanks to the dynamics of oil markets and Cold War geopolitics, was becoming tightly entwined with their everyday existence. But at the same time,

McAlister demonstrated, these texts provided a kind of semiotic pool out of which various groups in the United States – including evangelical Christians, Black nationalists, Jewish Americans, and others – fished interpretive frameworks for understanding themselves and US political culture. Thus “representations of the Middle East,” McAlister (2001, p. xiv) argued, “simultaneously figured the United States in relation to its ‘outside’ (in terms of international power relations) and in relation to its ‘inside’ (the diverse and hierarchical construction of identities within the national borders).”

Historians’ engagement with empire in the 1990s and 2000s had even more far-reaching effects in that new conceptual tools, such as borderlands, called geographically fixed notions of culture into question. Developed by cultural theorists interested in frontiers, or zones of intercultural contact, borderlands scholarship suggested that societies were rippled, rather than ringed, by sites of hybridity and heterogeneity (Kaplan, 1993). “Space is neither necessarily coherent nor always homogenous,” anthropologist Renato Rosaldo (1988, p. 87) explained. “Nor need it parce [*sic*] neatly into zones . . . It just could be, more often than we usually like to think, criss-crossed by border zones, pockets, and eruptions of all kinds.” If any given place was always as much host to pockets of the foreign as it was pockets of the familiar, culture was poorly understood in terms of territorial interiors and exteriors. Rather, culture was how *cultures* sharing the same space overlapped with one another in ways that simultaneously produced commonalities and differences. One such “contact-zone,” as Kristin Hoganson (2007, p. 8) has shown, was the White, middle-class home at the turn of the twentieth century. Hoganson’s *Consumers’ Imperium* explores the role of imports, such as foreign foods, armchair travel media, and exotic furnishings, in the making of US domestic culture, demonstrating how “consumption constituted a form of interaction with the wider world” (p. 11). As a study of femininity and domesticity in consumer culture, Hoganson’s book mined a wide variety of popular texts aimed at women – including cookbooks, home decor guides, and women’s magazines and newspaper pages – along with the records of a number of social clubs. This archive resembled earlier studies of gender and consumer culture. What set it apart, however, was that Hoganson’s historiographic framework attuned her to the many ways that an unmistakable interest in the *foreign* became virtually indistinguishable from the *domestic* in homes that sat hundreds of miles from the closest border.

Turn 4: Society, Structure, and Practice

At the start of the twenty-first century, the cultural turn began to turn back upon itself as some its earliest advocates asked whether the field was nearing a point of diminishing returns. To be sure, these critics remained committed to making culture an object of historical inquiry. But still, they wondered whether semiotic and discursive conceptions of culture had developed into a new orthodoxy that threatened to cloud historical vision. This critique took a number of forms. Some critics were

alarmed by what they saw as an extreme relativism introduced by postmodern thought, warning that deconstruction and discursive analysis threatened to “collapse” all sense of explanatory power in social research (Bonnell & Hunt, 1999, p. 10). Others suggested that words like “culture” and “discourse” had been stripped of their theoretical nuances and permitted to grow into totalizing concepts. According to this critique, historians had actually removed culture from the flow of historical time by suggesting that it was always already loaded into any given moment (Biernacki, 1999; Spiegel, 2005).

Others lamented a hollowed-out sense of purpose in academic history, looking back with some envy on the agendas of inclusion and democratization that had inspired much of the new social history (Eley, 2005; Enstad, 2008). As Geoffrey Eley (2005, p. 199) observed, cultural historians in pursuit of nuance had willfully distanced themselves from the “big structures, large processes, huge comparisons” (borrowing the term from sociologist Charles Tilly) of the new social history. But as Eley, himself an eager promoter of the cultural turn, remarked, “we may still want to talk about class, about capitalism, about the structural distribution of inequalities . . . Why should embracing the possibilities of microhistory require leaving macrohistory entirely behind?”

Historians of culture and society were by no means alone in their retreat from macro thinking. Daniel Rodgers (2011) has shown that late twentieth-century intellectual life in general was marked by a “fracture” of the social. In the process, strong notions of society characterized in terms of “wider and wider rings of relations, structures, contexts, and institutions” (p. 4) dominant as late as the 1970s gave way to market-inflected “visions of society as a spontaneous, naturally acting array of choices and affinities” (p. 264). William Sewell (2005) also suggested that in retrospect, it was possible, if not also disconcerting, to identify a common thread that wound its way through both the cultural turn and the rise of neoliberalism. For him, historians’ declining interest in large-scale political economic transformations had, to great irony, played out against the backdrop of one of those very transformations – the shift from a Fordist to a post-Fordist world economy. What these revisionist critiques shared in common was a sense that the cultural turn’s elision of the macro, structural, and material created a dangerous blind spot. The question, then, was how to preserve the conceptual strides achieved along the way – and indeed, continue to build on them by incorporating new strands of theory – but also restore the attention to structural power that had marked the new social history. The answer lay in finding new ways to connect the discursive with the material, essentially doubling back around to revisit and revise notions of cultural materialism.

Sewell (2005) has written more extensively about this topic than any other historian, and his work is worth examining in detail. To paint his argument in broad strokes: he sees structure and culture as mutually constitutive:

I claim that discursive or semiotic processes . . . are conditioned by and give rise to structures or forces governed by built-environment logics . . . and that such built-

environment logics condition semiotic processes (by stabilizing them, undermining them, or by subjectifying them to transformative pressure). (p. 368)

To arrive at this point, Sewell drew heavily on symbolic anthropology, but supplemented it with theories of structure and practice drawn from Marshall Sahlins, Anthony Giddens, and Pierre Bourdieu. He remained convinced, with Geertz, that culture could best be understood as the semiotic dimensions of life by which groups used sign systems to project coherence upon the world; it was critical to remember, however, that this was always a “thin coherence” (p. 166) because language, when put into practice, is imperfect, polysemic, and subject to change. To explain this plasticity, Sewell pointed to the tendency of the material world to, at times, act upon and transform cultural schema, despite those schemas’ best efforts to call the world into order. “Cultural categories,” he writes (paraphrasing Sahlins), “are worldly facts. They burden the world with potentials for human use . . . And they are burdened by the things they mark, dragged into new constellations of meaning when the course of action doesn’t go as expected” (p. 218). Sewell’s work suggests that culture can be studied both synchronically to examine intricacies of meaning at a given *point in time*, and diachronically to trace how meaning is materially structured and restructured as a “built environment” *over the course of time*. Micro and macro, long term and short term, and culture and structure are thus instantiated together within a “constructed” environment of social relations shaped by the various ways that meaning making and materiality weigh upon one another.

Whereas Sewell’s materialism points to the hard physicality of architecture and geography, Gabrielle Spiegel (2008, p. 411) has advocated a “neo-phenomenological approach” that points more to the fleshy physicality of the body. Like Sewell, she sees meaning as grounded in material practices and created in the flow of time. Her approach differs, though, in that she draws largely from reflexive sociology. At one level, the neophenomenological approach explores the interplay between embodied action and structured social experience, or what Bourdieu (1980/1990) called the “habitus” and Giddens (1984) has called “structuration.” In doing so, it seeks to highlight the inherently corporeal and situational nature of interpretation by which the world and one’s place in it is made knowable at the level of individual consciousness in ways that are socially conditioned, but nevertheless diverse and unpredictable. “Historical investigation . . .,” she explains, “would take practices (not structure) as the starting point of social analysis, and practice itself assumes the form of a sociology of meaning” (p. 412).

Spiegel points to the work of sociologist Andreas Reckwitz as particularly helpful here. Social practice, as Reckwitz (2005, p. 252) defines it, is “a routinized way in which bodies are moved, objects are handled, subjects are treated, things are described and the world is understood.” Irreducible to any one facet, the different elements of a given practice are mutually generative and hang together according to some internal logic. The businessman who breaks off his lunch order to brusquely answer his mobile phone is carrying out a practice. Such acts are social in that they involve

intersubjective forms of knowledge and culturally recognizable ways of acting that, like the habitus, are transposable across situations and between actors occupying similar social worlds. “When we learn a practice,” Reckwitz explains, “we learn to be bodies in a certain way” (p. 253).

Media Culture and Materiality: Culture Industries, Senses, and Books

The reworked culture concepts discussed above lend themselves well to communication scholarship. They retain an anthropological conception of social experience as grasped and reproduced through sign systems – which we might call the fruits of the cultural turn. In addition, they remain astute to the various ways that social inequality can be discursively generated within sign systems – the fruits of the linguistic turn. Yet the new frameworks build on these insights by recognizing that material objects, practices, and institutions can exert an outsized influence on the semiotic reproduction of social life. The remainder of this essay will explore three particular frameworks for studying media history that complement the new cultural materialism – the history of culture industries, the history of the senses, and the history of the book.

We might call the first framework the culture industry reconsidered. As discussed above, the rediscovery of the Frankfurt School in the 1970s played an important role in sparking the cultural turn. Once the turn was well underway, though, notions of rationalization, control, and commodification largely fell out of intellectual fashion. And just as importantly, the Frankfurt School’s eviscerations of mass culture made it anathema to a whole generation’s worth of scholars whose projects aimed to reconstruct the contested nature of culture in a particular place and time. Yet, as James Cook (2008) has pointed out, the “culture industry,” when used as a means to understand the business of culture rather than to assess its worth, offers a powerful lens on the past. “By moving the term ‘culture’ from noun to adjective . . .,” he remarks, “we shift the conceptual emphasis from qualitative measure to mutable institution” (p. 297). Moreover, the culture industry concept is well suited to connecting specific texts to larger structures of power. “Industry,” Cook points out, “simultaneously signifies a microlevel site of production and a macrolevel system of circulation” (p. 297). Finally, the concept’s focus on particular industry processes, including “standardization, distribution, marketing, and integration” (p. 297), provide the historian with specific, but by no means predictable, paths to follow. When carefully reconstructed, these processes open a window into bygone work cultures that in themselves are rich and complex microcosms of a particular time. Beyond that, these worlds can tell us much about what happens when the logics of business meet the logics of cultural expression.

David Suisman's *Selling Sounds* (2009) offers a good example of an updated culture industry approach. Suisman's book can be read as a history of many things – musical trends, recording and playback technologies, city life, copyright law, Jewish American culture, African American business culture, and various other topics. But in sum, these parts tell a bigger story about the commodification of American music in the early twentieth century. “Commodification is not . . .,” Suisman is careful to note, “an instantaneous occurrence, like the flash pasteurization of milk. It is a social and political process, populated by human actors, and one that includes various dimensions and phases” (p. 9). Thus he reconstructs the methods by which publishers applied the twin logics of industrial capitalism – mass production and mass marketing – to popular music in the United States. This involved regimented production processes in the songwriting factories of Tin Pan Alley, sophisticated forms of market research, national marketing networks, and concerted efforts to reshape the politico-legal framework that governed the musical marketplace.

The story Suisman tells is a top-down affair and he relies largely on a mix of primary sources most associated with business history – corporate archives, trade journals, company publications, and the personal papers, memoirs, and oral histories of industry players. These sources allow Suisman to provide a detailed account of the music industry's rise. At the same time, his sophisticated use of culture industry concepts allows him to also tell a story about the capacities of consumer capitalism to drive far-reaching changes in culture. As he points out, commercial music's remarkable popularity helped make it a seemingly natural accompaniment to everyday life.

In making this last point, Suisman identifies how the industry not only introduced a new musical culture, but in doing so overhauled the sensory environment of everyday life. “As a consequence,” he argues, “the soundscape itself became a field of marketing, the aural equivalent of billboards . . . but far more invasive” (p. 14). Vision and hearing, Suisman contends, create different corporeal relationships with the outside world. Eyes can be averted, ears cannot. “Through the eye, you see the world *out there* . . . through ear, you hear the world in your head; it enters *inside you*” (p. 14). Suisman's attention to these phenomena makes *Selling Sounds* a good example of the second framework: the history of the senses. This growing field seeks to historicize the senses in terms of practice, discourse, meaning, and experience. To take sight/vision/eye/seen (but one could easily substitute hearing/ear/heard, scent/nose/smelt, and so on) as an example, the history of the senses can generate a host of interrelated questions: How have people used sight differently in various eras? How have ideas about vision changed over time? How have images of the eye conveyed very different meanings at different times? How has the seen environment changed over time?

Raising such questions historicizes fundamental aspects of experience and culture that are often overlooked. In this regard, the senses provide a fresh lens to re-examine well-researched subjects. To take a hypothetical example, a history of censorship during World War I might look very different when approached as a history of visual

practices. Such a history might focus on the training of censors and the everyday work of blotting out objectionable imagery. Moreover, by emphasizing the embodied and phenomenological nature of meaning making, these questions allow us to see how every act of perception collapses the boundary between micro and macro, “nature and culture,” and “other perennial oppositions,” as Martin Jay (2011, p. 309) has observed. An attention to the senses perhaps accounts for the enduring originality of Susan Douglas’s *Listening In* (1999/2004) which made the aural dynamics of radio listening central to the history of broadcasting in the United States. More recently, Andrew Kahrl (2008, p. 1125) has shown how “whites’ auditory reception” of African American leisure pursuits helped to shape the dynamics of crime and the segregation of public space in Progressive era cities. “Cloaked in race-neutral language and dedicated to improving the quality of city life,” Kahrl writes, “noise crimes served as a convenient device for racializing concepts of civility and disorder” (p. 1125). In this regard, the history of the senses can call attention to the materiality of cultural life, highlighting the extent to which the social world is constructed and reconstructed to affect the senses in particular ways. Pointing to the many ways that the world is reordered to cater to visual practices, W. J. T. Mitchell (2002, p. 92) has remarked that “it is not just that we see the way we do because we are social animals, but also that our social arrangements take the forms they do because we are seeing animals.”

The final approach – the history of the book – offers another means of bringing materiality to the forefront. Book history developed in the last quarter of the twentieth century as scholars, dismayed by the abstracted treatment of printing, literary works, and literacy in academic study, aimed to situate these phenomena in specific social, cultural, and economic environments. The discipline’s misleadingly narrow name derives from its early association with the history of print technology and bookselling in early modern Europe, but it has since grown to encompass the broad study of print culture. During this expansion, much of the field’s intellectual energy has been directed toward probing the endlessly diverse ways that audiences have read and used texts (Nord, 2008).

Like the history of the senses, book history offers a “point of view” (Hall, 1996, p. 30), in this case, focusing the historian’s gaze on an interrelated set of activities – reading, writing, publishing, printing, distribution, retail, filing, storage, and almost anything else involved in the organized circulation and use of information. On close inspection, any one of these activities can assume unexpected shapes and lead in surprising directions: books are pirated; newspaper boys strike; magazines are cut up and turned into artwork; and gamblers pore over morning papers in search of yesterday’s numbers. Similar to the benefits of the revised culture industry approach, the history of the book forces historians to think about the production and use of texts within vast circulatory networks, or what Robert Darnton (2007) has called a “communications circuit.” Recently, Carl Kaestle and Janice Radway (2009) have advocated a looser, yet still systemic, understanding of print culture. Their approach sees print as a meeting ground where a diverse cast of social actors “interested in the production, use, control, and limitation” (p. 19) of particular texts are mapped

together in spontaneous but structurally conditioned networks. In either case, book history has the capacity to turn any one piece of print matter – to take a hypothetical example, a colorful trade card propped up on the counter of a store in 1880s New Orleans – into a portal on a whole social world, linking the various actors, institutions, and cultures through which it passed.

Sam Binkley's (2007) *Getting Loose* provides such an example, speaking to the many possibilities a book history approach can afford. Binkley's study recounts how countercultural tastes were transformed in the 1970s into a mainstream consumer ethos. He reconstructs this process through the fulcrum of the West Coast publishing scene, analyzing publications such as the *Whole Earth Catalog* and the bestselling *Tassajara Bread Book* "as narrative texts and also as material things whose unique formats and design features often tell stories as valuable as the written messages they convey" (p. 20). In terms of narrative, Binkley is able to situate the ideas and trends that animated these projects within a particular place and time – the San Francisco Bay Area of the late 1960 and 1970s. But also, he's able to follow the diffusion of these texts and discourses across national "social and economic networks" by studying the institutional linkages that formed between craft "hippie" presses, such as San Francisco's Bookpeople, and the mainstream publishing giants of New York City. And finally, Binkley's close attention to materiality – in particular, the unfinished aesthetic of the publications themselves – enables him to connect bodily practices, such as the tactile pleasures of handling rough paper stock, to an emerging popular ideology: getting in touch with one's natural self.

To close, history's engagement with the complexities of meaning in recent decades has yielded an array of useful frameworks for thinking about culture and society. Some have shown themselves well suited to recovering the "thick," multidimensional meaning of a communicative act frozen in time; others have proven better suited to explaining issues of culture and power. Because they drive the questions historians ask about their subjects, these frameworks can have direct implications for what sources are drawn upon and how those sources are interrogated. Many book historians gravitate toward evidence that allows them to map the flow of material texts through social networks. Historians of the senses, on the other hand, place a premium on sources that document contemporary accounts of sensory experiences. It is important to note that no one historiographic approach should be seen as entirely adequate in itself. Though these frameworks have developed in the flow of time, they have not superseded each other. Indeed, recent developments tell us that the most vivid and panoramic views of the past might come from circling back around to retool old concepts and combine them with the new.

Historical Approaches to Media Studies

Mark Hampton

ABSTRACT

In recent decades, media history has become increasingly prominent, with scholarship emerging from a wide variety of disciplines. This chapter examines the methodological issues involved in conducting historical research in media studies. Using Adrian Bingham's *Family Newspapers?* and Laura Beers's *Your Britain* as case studies, it explains such topics as historical context, locating primary sources, and the production and reception of media texts. In addition, it outlines the wide variety of historical approaches that can be employed, including textual analysis, policy history, institutional history, and biography.

Introduction

It has been more than 20 years since James Curran (1991, p. 27) referred to historical scholarship as the “neglected grandparent of media studies.” Since that time, media history has become increasingly prominent, with scholarship emerging from such diverse disciplines as history, literary criticism, communication, and sociology. The field has an institutional home in such research centers as the University of Sheffield's Centre for Journalism and History, the Aberystwyth University's Centre for Media

The International Encyclopedia of Media Studies, First Edition.

History, and Macquarie University's Centre for Media History; such journals as *Historical Journal of Film, Radio and Television* (published by the International Association for Media and History), *Book History* (published by the Society for the History of Authorship, Reading and Publishing), and *Media History*; and book series such as the University of Illinois Press's History of Communication series and the Palgrave Studies in the History of the Media. In addition, leading journals in the fields of communication, media studies, and journalism regularly publish articles containing a historical focus, while mainstream historical journals increasingly include articles concerned with the mass media. Finally, media history has found an increasingly prominent home in specialized journals within business history, such as *Technology & Culture*, *Enterprise & Society*, and *Business History Review*.

At its best, media history is interdisciplinary, combining the methodologies of one or more "theoretical" disciplines with the historian's emphasis on empiricism and deep context. Both aspects are crucial. Sophisticated theory does not substitute for thorough engagement with primary sources, nor does consulting a massive amount of archival material compensate for the lack of well-framed research questions. At the same time, even when it stems from contemporary concerns, the best media history avoids anachronism, recognizing instead that the historical period under consideration is not *merely* the background to the present, but was shaped by concerns and structures that were different from ours. This chapter will describe a range of questions and approaches with which media history is concerned, and the types of sources that may be used. It draws heavily on my own experience working mostly on the history of journalism and print culture, in illustrating approaches and obstacles that will also structure the work of historians in other areas such as cinema and television, advertising, and media organizations. In addition to citing examples along the way, mostly from the field of modern British history, this chapter will provide case studies of two recent books in order to illustrate "best practice" in media history.

It may be worth clarifying at the outset that this chapter will not specifically address the methodologies of historically minded sociologists, literary critics, and other critical theorists. This is not in any way to minimize their contributions to media history. To the contrary, such works as John Thompson's *The Media and Modernity* (1995) and Jean Chalaby's *The Invention of Journalism* (1998) have done much to advance our thinking about how media function in modern society, and how this function has changed over time. Yet their methodologies are different from those discussed here. They are based mostly on secondary literature, and their originality lies more in theorizing existing historical scholarship than in analyzing primary sources. For the purposes of this chapter, such works provide valuable theories with which to engage, helping to sharpen the historian's research questions and approach to primary sources. They are not, however, the type of scholarship with which this chapter is concerned.¹

As Curran (2002) has pointed out, a great deal of media history is "media-centric," inward-looking rather than illuminating connections between media and the wider cultures and societies in which they operated. Although there is certainly value to

historical scholarship whose main purpose is empirical “recovery,” the most influential works of history are those that move beyond their immediate topic to address larger questions. For example, Michelle Tusan’s *Women Making News* (2005) not only analyzes women’s advocacy newspapers that had previously received little scholarly attention; it also contributes new insights about the suffrage movement, cultural constructions of gender, and extra-parliamentary politics in late nineteenth- and early twentieth-century Britain. Similarly, Simon Potter’s *News and the British World* (2003) uses multicontinental archival excavation not merely to examine how news organizations operated in the United Kingdom, Australia, Canada, New Zealand, and South Africa, but to understand the institutional basis for a transnational Britishness. What is notable about both of these books is that they are just as interesting to historians who are not, *per se*, concerned with media history, as they are to media historians. Indeed, some of the best media history is written by people who do not think of themselves primarily as media historians. Jonathan Silberstein-Loeb, for example, who has published important work on the news market in late nineteenth-century Britain and the United States (2009, 2012, 2013), identifies himself more as a historian of business and institutions than as a historian of the media (personal communication, July 6, 2012).

Within the broader field of media history, several distinct approaches are possible: these include cultural or intellectual history, political history, social history, economic history, institutional history, medium history, and biography, though in practice most research projects will belong to more than one category. The researcher will need to decide whether to focus on a specific medium or genre (e.g., Conboy, 2010; O’Malley, 1994), on a specific theme that cuts across multiple media and genres (e.g., Webster, 2005), or on the interactions between different media (e.g., Becker, 2008). In addition, the scholar needs to decide whether to restrict his or her topic to a specific national case, which is the most common approach, or to write a comparative or transnational history (e.g., Hilmes, 2011; Richards, 2010; Wiener, 2011; Winseck & Pike, 2007). Each of these approaches implies different research questions, different ancillary disciplines, and different types of primary sources.

In addition to choosing a broader methodological orientation, the researcher will have to address the ever present challenge of casting the topic in a sufficiently expansive manner to be of wide interest while at the same time keeping it sufficiently focused to be manageable. This dichotomy is particularly pressing for postgraduate students caught between the increasingly competitive job market and the pressures to finish quickly – gone are the days when PhD students were allowed to spend six to 10 years writing a dissertation. At the same time, navigating this dual challenge as a postgraduate student is good preparation for an academic career, given that “accountability” regimes – whether they be the UK’s Research Exercise Framework or the American tenure clock and post-tenure review, among other models – simultaneously emphasize the number of publications and “impact factor.”

In attempting to balance significance with manageability, researchers may wish to focus on a short time period that can be seen as a turning point or a synecdoche, or

to address a longer chronology through a number of case studies. The former strategy can be seen *in extremis* in W. Joseph Campbell's *The Year That Defined Journalism* (2006), a book that focuses on a single pivotal year but examines the emergence of three paradigms that came to define twentieth-century American journalism, and L. Perry Curtis's *Jack the Ripper and the London Press* (2001), which begins from an even narrower starting point but effectively illuminates late Victorian journalism and cultural anxieties. Other examples include Dale Zacher's *The Scripps Newspapers Go to War* (2008), which examines an American newspaper empire's adaptation to World War I; Robert McChesney's *Telecommunications, Mass Media, and Democracy* (1993), which focuses on a pivotal seven-year period in which the commercial basis of American radio was established, defeating attempts to organize radio along public service lines; and Siân Nicholas's *The Echo of War* (1996), which addresses the British Broadcasting Corporation's role in maintaining British civilian support during World War II. The latter strategy is exemplified by Michael de Nie's *The Eternal Paddy* (2004), a study of Irish identity in the British press over a period of nearly a century that employs case studies of four key events, and Richard Kaplan's *Politics and the American Press* (2002), which analyzes the national emergence of the journalistic norm of objectivity over half a century through a focused examination of Detroit.

Methodologies, Topics, and Research Questions

As noted above, types of media history include cultural or intellectual history, political history, social history, economic history, institutional history, medium history, biography, and community studies, among others. In practice, these approaches are not distinct, both because the best practitioners of a particular approach will draw on contexts that imply a second or third approach as well, and because many historians self-consciously combine these approaches. For example, the so-called "new political history" that emerged in the 1990s, through its focus on language, effectively merged cultural, intellectual, and political history approaches, while the "social history of ideas" places intellectual history within deep social contexts (Clark, 2004; Jenkins, 2003; Tosh, 2010). Some beginning researchers may wish to identify which approach to history most strongly appeals to them before choosing a topic; others may prefer to identify topics or research questions first, and then consider which approaches these imply.

When selecting a topic for one's first major research project, the media historian, like any other scholar, is well advised to avoid merely looking to "fill a gap" in existing scholarship; such projects tend to have little influence. Instead, it may be helpful to think about a field in which one is interested, and ask such questions as the following: Are there any widely prevailing, *significant* assumptions that most scholars seem to share, but which have not been sufficiently examined and could be incorrect? Are there events, institutions, or ideas of clear contemporary importance whose

origins have not been adequately explained? Is there a clear difference between two eras with no satisfactory account for the change? For the comparative-minded scholar, are there surprising similarities or differences between two places that have not been sufficiently understood? Are there significant primary sources that have not been previously examined, whether through neglect or because they are newly available? To these questions, which are appropriate for all historians, the media historian may add: Are there topics whose previous study has been too media-centric, so that a more deeply contextualized re-examination might lead to a more accurate or sophisticated understanding? Such questions can be illuminated through an interplay between primary sources and secondary literature, though it is also important to note that many of the best questions will be discovered serendipitously, through browsing through primary sources with an open mind.

It may be useful to share my own experiences in selecting my first research topic in media history, my PhD dissertation topic, in order to illustrate at least three points that beginning researchers should keep in mind. First, one should select one's topic with a particular audience in mind. I came to my topic from the opposite direction of many potential readers of the present chapter: rather than a media scholar looking to apply historical methodologies to my field, I was trained as a historian and became interested in late nineteenth-century transformations in British political culture and subsequently in popular journalism. At the time, this latter subject was not very well developed and largely ignored by mainstream British historians, even as an increasing number of them used newspapers as primary sources (Bingham, 2012a, 2012b). Moreover, of the three most significant historical monographs that focused on this period (Brown, 1985; Koss, 1981–1984; Lee, 1976), two of them were more descriptive than thesis-driven. I became interested in Alan Lee's thesis that what he called a "liberal" theory of the press had predominated among political elites in mid-Victorian England, and that it had been undermined by commercial changes in the later nineteenth century. At the same time, I was dissatisfied by what I took as his implication that in this atmosphere idealism simply gave way to the pursuit of profits, and I set out to learn what had, in fact, become of "theories of the press" between 1880 and 1914. My audience, in the first instance, was historians of turn-of-the century British politics and culture.

Second, my dissertation writing experience highlights the ways in which selection of topic shapes the availability of primary sources. I divided my topic into three discrete focuses: elite discourse about the press, found especially in books and periodicals from the period; journalists' professional discourse, as seen in memoirs and handbooks and in the trade publications of an emergent professional organization, the Institute of Journalists; and a case study of a liberal editor's attempts to put his ideals into practice in wartime, namely C. P. Scott of the *Manchester Guardian* during the South African or Boer War (1899–1902). One practical difficulty I faced was that, although there was a great deal of published primary source material available, the historical profession tends to fetishize unpublished manuscript sources found in archives. Given my topic, however, this was not a straightforward task. It turns out

that even the most idealistic journalists, politicians, and intellectuals tend not to pepper their unpublished personal correspondence with ruminations on the role of the press in society; nor do the business records of newspapers generally speak to this theme. To be sure, I did find some useful unpublished archival material – above all, in the case study of the *Manchester Guardian* – but published primary sources remained the most important source for my dissertation.

Third, my experience underscores the importance of adaptability. My research developed according to accidental discoveries in archives and in response to recommendations by other scholars I met during my research, which was mostly carried out in London in the United Kingdom. In addition, 18 months into my dissertation period – that is, halfway through the three years I was allotted – Aled Jones published his pathbreaking *Powers of the Press* (1996), which covered a similar topic to mine, with an overlapping chronology. Although Jones himself was quick to assure me that his book had not exhausted the topic, this did force me to consider how my topic would remain distinctive. In addition, even after completing my dissertation, the process of trial and error continued, as I thought about publication plans. I fairly quickly decided that the dissertation was less cohesive than I would have liked, and that in its present state it did not constitute the book I wanted to write. I decided, therefore, to write a book focusing on elite discourse, expanding it to cover the period from 1850 to 1950; the other two sections of my dissertation, dropped from the book, became three discrete articles. At the same time, whereas my dissertation had been aimed primarily at historians of late nineteenth-century Britain, I deliberately addressed the book to scholars concerned with contemporary media studies and journalism.

Sources

A wide range of primary sources exists for researching media history; as indicated above, the sources one employs will depend upon the topic one chooses and the research questions one asks. It will also, in many cases, depend upon the researcher's family commitments and financial resources; not every topic is equally practical for every researcher. Some topics will require extensive travel to distant archives – this can involve air fares, driving expenses, or rail fares; lodging costs; and sometimes even entrance charges to archives, costs that can add up to several thousand dollars very quickly. In some cases, one's own department or university will make travel funds available, whether competitively or as a matter of course; some libraries offer competitive grants for scholars with a specific need to consult their collections; and some disciplinary organizations provide small competitive grants for postgraduate students. In other cases, though, such costs will have to be borne by the researcher herself or himself. This section will provide a brief overview of the kinds of primary

sources available, and methods of using them, along with selective examples; it is meant to be suggestive rather than exhaustive.

An obvious source is media products themselves: newspapers and magazines; films, radio, and television programs; and the like. Despite an explosion over the past few decades of scholarship devoted to content analysis, the surface has barely been scratched, and a researcher can pretty easily find untapped content. Indeed, the content is so vast that the more difficult problem may be how to choose – that is, how to limit the scope of sources used while still making a claim to scholarly significance. As mentioned above, carefully defining one's topic is essential, and using case studies may be very beneficial.

At the same time, in many cases scholars are limited by the uneven availability or accessibility of sources, particularly television and radio recordings. For example, Vanderbilt University's Television News Archive holds broadcasts of American national television network news since mid-1968, but recordings of local news or pre-1968 news are more difficult to find. In other cases, researchers are constrained by the non-availability of travel funding: the British Newspaper Library at Colindale contains a wide range of historical newspapers from around the world, but most of them are not indexed and their availability, in practice, depends upon a researcher being able to devote long periods to labor-intensive reading, often on microfilm.

An increasing number of newspapers are available digitally, for example Readex's America's Historical Newspapers and Gale Cengage Learning's collection of pre-1900 British newspapers; both, however, require expensive subscriptions, and so they are best suited to researchers who have access to a subscribing library. On the other hand, the British Cartoon Archive at the University of Kent at Canterbury has a searchable database containing thousands of cartoons from newspapers and magazines, downloadable free of charge; the archive holds the originals on site, and will provide high-resolution digital copies for a fee. Similarly, the US Library of Congress has recently made available a large collection of historical newspapers accessible online at no cost to researchers. As Bingham (2010) notes, digitization opens possibilities for more efficient research, as well as new and sophisticated methodologies of data mining. As he also points out, however, the uneven digitization of titles risks distorting the historical record, if scholars focus disproportionately on what is available electronically; for example, two twentieth-century British popular dailies, the *Daily Mirror* and the *Daily Express*, have been digitized and are available from UKPressOnline, but the *News of the World* has not. Digitization also perhaps increases the temptation to take articles out of context, thanks to the easy ability to search by keywords, though as Bingham points out, this problem is hardly unique to the use of digitized newspapers. Prior to digitization, for example, scholars could be tempted to over-rely on those newspapers, such as *The Times*, that were comprehensively indexed, or to mine periodicals for keywords by using such periodicals indexes as the *Readers' Guide to Periodical Literature*, *Poole's Index to Periodical Literature*, or the *Wellesley Index to Victorian Periodicals, 1824–1900*. In any case, if used judiciously, online newspaper databases

offer exciting possibilities for researchers (see also Mussell, 2012a, 2012b; Towheed, 2010).

Nor is digitization limited to print media. Video Active maintains a large collection of European television footage, while the United Kingdom's BBC and ITN have both made an increasing amount of footage available. The BBC's online archive includes not only its own material, but news footage from the Australian Broadcasting Company, CBS News, China's CCTV, and others. The Centre for Media History at Macquarie University has recently opened the Media Archives Project database and the Australian Media History Database. As with digital newspapers, many such collections are available commercially, while others are often available through one's university library.

Many media institutions maintain archives of correspondence and business documents, but they are not all equally useful, nor equally accessible. Some organizations, operating with a sense of their historical importance and commitment to open inquiry, have turned over at least their earlier archival material to public repositories; for example, the *Manchester Guardian* (forerunner of today's *Guardian*) has its collection at the John Rylands library in Manchester, earlier *New Statesman* materials are available at the University of Sussex, and the National Union of Journalists' archives are held at the University of Warwick's Modern Records Centre. Such collections are easily available to researchers, though even in these cases it is important to find out what an archive's access policies are ahead of one's visit. Other institutions maintain control over their own archives, which they regard, in the first instance, as company property rather than a public trust. Many of them will make their archives available to researchers, but devote limited resources to doing so and, as a result, cannot accommodate very many researchers at a single time. One example comes to mind from my own research: the Reuters archive located in the company's Canary Wharf office. When I used this archive in 2006, a single (very knowledgeable) archivist worked from a desk in an open-plan office among perhaps 200 other desks. Materials were located in an off-site warehouse, and after I identified the files I wished to consult, the archivist took me to the warehouse by taxi, placed the desired files in a suitcase, and brought me back to the Reuters office where I sat at the desk next to his and consulted the material. Again, such archives, despite an archivist's best intentions, simply cannot accommodate very many researchers at once; for this reason, it is particularly important to contact the archive well in advance of an intended visit.

Other archives may be less accessible, particularly for scholars researching commercial institutions that continue to operate today. These institutions may categorically refuse admission, or may ask very specific questions about one's purpose. In some cases, this is a matter of protecting the company's interests, whether by guarding its reputation or by controlling access to proprietary information. In other cases, as already noted, it is simply a question of the limited resources devoted to accommodating researchers whose interests are, of course, peripheral to the corporation's concern to return value to shareholders. The archivist for *The Times* (London), for example, several years ago refused my request to consult the archive because I was

on a fishing expedition; if I wanted to consult the archive I needed to be able to identify more precisely in advance what I was researching. He told me that the number of requests for admission was fairly large, and he could not accommodate researchers who did not have specific archival materials in mind. To take another example, a newspaper (which I will not name) recently granted an acquaintance of mine limited access to company archives after persistent requests; the company has, though, required the researcher to sign a nondisclosure statement, allowing the company to inspect the resulting research prior to any publication. These kinds of refusals or conditions are legitimate decisions by companies that do, after all, own the materials; from the researcher's point of view, however, they are potential obstacles that have to be considered.

In addition to the archives of institutions, many individuals important to media history have archives, either in private hands or, more often, deposited with a professional archive. In many cases, the collection will be located in a region or with an institution with which the figure had a connection. For example, the papers of C. P. Scott, the long-time editor (and later owner) of the *Manchester Guardian*, are on deposit at the John Rylands Library in Manchester. Similarly, the archive of press baron Lord Beaverbrook is located in the Parliamentary Archives (formerly called the House of Lords Record Office). In other cases, the collection may appear in a seemingly random place, often as a result of university libraries' special collections empire-building. For example, the archive of Cecil King, nephew of British press baron Lord Northcliffe and chair of the Mirror Group of newspapers, is located at Boston University.

In other cases, relevant archival material may not be conveniently assembled into a single archive, but may be scattered across numerous repositories, or across disparate collections within the same library. This may occur, for example, in the case of a prolific letter writer for whom no personal archive exists, or who did not keep copies of the letters he or she sent; that person's letters would be scattered among the archives of their recipients. More broadly, since most archival collections center around individuals, organizations, or institutions, research topics that are structured differently from the archives – for example, the study of a concept or a social practice – may require consulting multiple archives. The cinema historian Peter Miskell has noted that his work on the foreign distribution of Hollywood films has often required him to consult archives that are organized more helpfully for researchers interested in a specific director, writer, actor, or film, than in his chosen topic (P. Miskell, personal communication, September 25, 2012).

There is no formula for locating potentially useful archival material. Beginning researchers may often find clues in the bibliographies of existing secondary literature. When looking for a collection based on a specific individual or organization, a few minutes of searching online may be sufficient to discover an archive's existence. The task is more complicated when looking for material for which no specific collection exists. In the case of the United Kingdom, a large number of archives are searchable by keyword through Access to Archives, found on the National Archives website

(www.nationalarchives.gov.uk/). Using this website, for example, I located material relating to postwar Hong Kong in such unlikely places as the Oldham Local Studies and Archive and the Surrey History Centre. Researchers are also advised to take advantage of networking opportunities; some of my own most useful leads have come from asking the advice of other scholars who work in the same field.

Most historians accept that their research may require extensive travel time, but this needs to be weighed carefully before committing oneself to a research topic. It is not merely a question of where archives are located. Different archives are more or less user-friendly, and this needs to be taken into account well ahead of one's research trip, particularly for researchers on a tight schedule or who are traveling a great distance. Many archives allow unlimited nonflash digital photography, either free of charge or with a modest per day fee, a policy that can dramatically reduce the amount of time necessary for collecting material, thereby reducing one's travel costs immensely. For example, I have collected thousands of pages of material from the National Archives (London) in a matter of days, allowing me to consult the material at a more leisurely pace upon returning from my research trip.

Other archives have more restrictive policies. Some, including the British Library, do not allow digital photography at all. Some require various unusual conditions. For example, at the Women's Library (London Metropolitan University), the charge as of summer 2010 was £4 for a one-day pass allowing only 25 photographs. In addition, the library required the user to fill in a copyright form describing every *individual* item photographed, and each pass – that is, every 25 photographs – required a new payment on a different floor than the archive. Aside from the prohibitive cost, the cumbersome paperwork requirement would make extensive photography impractical. Another archive I have recently used, the Hong Kong Public Records Office, allows photography only of items on which the Hong Kong Government holds copyright; other items can be photocopied. After the archivist determines that a requested item may be photographed, a member of staff will accompany the researcher to a designated room, and will turn the pages while the researcher takes pictures. The researcher is well advised to learn such policies in advance so as to plan his or her trip accordingly, or even, in extreme cases, to decide against a particular research topic. In most cases, archives that do not allow digital photography will have fairly high photocopying charges, often anywhere from 40 cents to \$1 per page; this means that unless the researcher either has a large photocopy budget or can afford to devote a significant amount of time on site, it will not be practical to select a research topic that requires heavy use of such an archive. It should be noted, though, that digital reproduction – like photocopying for those with generous research budgets – can tempt the student to become injudicious in collecting too much material. In some cases, indeed, it can lead to information overload, creating the illusion that one has conducted “research” when one has merely collected a massive amount of archival material, not all of it relevant, that will still need to be sifted when one returns home.

Using the Sources

In conducting research based primarily on content analysis, it is important to give attention to the sources' context and provenance. Various contexts include presentation, production, and audience. Presentation is the most straightforward. A researcher examining a series of newspapers, for example, in order to see how a particular theme was conveyed, should look not only to the specific presentation of the topic at hand, but also to its placement within the paper as a whole. Was the topic covered on the front page – and if so, was it above or below the fold? Or was it relegated to a more obscure location? How many column inches did the topic merit compared to other topics? Was it addressed in hard news columns, in editorials, or in various lifestyle features? These are only among the most obvious questions; the point is that the researcher should not restrict himself or herself to content analysis of a single theme in isolation from surrounding content.

Production and audience can be more difficult, and they constitute a reason that even a project focusing primarily on content analysis often needs to include archival research. Wendy Webster's *Englishness and Empire 1939–1965* (2005) demonstrates this point. Although it centers on analyzing the ways in which films' and television programs' depiction of empire during World War II and the early period of decolonization helped to construct English national identity, it draws on far more than content analysis. Among other sources, Webster's book draws on BBC files discussing production and policy decisions and audience research, various government collections, and reviews and letters from a wide range of newspapers. Had Webster limited herself to content analysis alone, her book would have been decidedly less successful. Similarly, Hajkowski (2010) combines analysis of BBC programming content with archival material illuminating the process by which programming decisions were made.

If archival sources are often necessary for the contextualization of content analyses, they are even more crucial for research questions focused on biography, political history, or institutional history. For example, Simon Potter's *Broadcasting Empire* (2012) traces the diffusion of the BBC's model of public service broadcasting to Australia, Canada, and New Zealand, a task that can be accomplished only through extended analysis of internal memoranda within institutional and government archives in the four countries. Similarly, Zacher (2008), noted above, can understand how the Scripps company responded to the changing commercial and political environment during World War I only through examining company archives.

Yet historians often find, much to their frustration, that archival sources do not always contain the answers they seek (Howell & Prevenier, 2001). A historian's interest in a particular nugget of information does not mean that an earlier observer would have thought to notice it or record it for posterity, or that someone would have collected it in an archive. For example, Jones (1996) makes the point that the

authors of anonymously published nineteenth-century journalism can only sometimes be identified by journalistic diaries or other sources; in many cases, that information is lost forever. Likewise, Simon Potter has noted that for much of their history, broadcasters neglected to save copies of their films, forcing researchers to rely on transcripts – and even those were not always saved (personal communication, July 6, 2012). Often this problem is largely accidental, though as Epstein (2012) has vividly demonstrated, archives can reflect the political interests of those who originally produced the documents. This difficulty cautions us to the need both to read documents critically and to draw conclusions judiciously, recognizing that the picture conveyed in the archive is not straightforwardly “reliable.”

In recent years, scholars have become increasingly interested in audience response to media. This interest has grown both out of a concern for “history from below” and from the critical point that audiences, as much as authors, create meaning. Unfortunately, this approach is easier to articulate than to execute, particularly for the centuries before opinion polls, audience research, and modern sociology. For earlier periods, available evidence is often patchy or unrepresentative. The field of book history, in particular, has given growing attention to “reader response,” but surviving primary source evidence is disproportionately concerned with elite views. Where evidence is available of working-class reader response, moreover – for example, in the autobiographies discussed in Rose (2001) – it often refers to texts less ephemeral than newspapers and magazines (Hampton, 2009).

This point is highlighted by the recent development of the *Reading Experience Database, 1450–1945* (RED), an impressive and highly valuable database documenting the ways in which reading took place in Britain between 1450 and 1945. This project invites submissions of any documented reading experience within that period, and they are carefully vetted by the editorial team: as Bradley (2010, p. 152) notes,

Each record is extraordinarily comprehensive, detailing where known not only the name/ author/type of text being read, but also the date of the reading, the reader’s name, their gender, social background, religion, date of birth, whether other readers were present, even the time (morning/ afternoon/night) and the place of the reading experience.

This is an ongoing project, and its comprehensiveness will in the long run depend not only upon the cooperation of interested researchers, but more fundamentally on evidence that actually exists. Not surprisingly, most of the authors identified as being read are canonical authors, not obscure journalists, and a large number of the readers are themselves well known, upper- or middle-class figures; it is not clear that this will change as the project expands. As with any archive, the *Reading Experience Database* does not necessarily address a particular topic that may interest a given researcher: Nicholson (2012) notes, for example, that it does not provide an entry relating to the consumption of American humor in Britain.

This project underscores the partiality of the archival record in another way: according to Bradley (2010), as of early 2010 well over half of the “reading experiences” available in the database are from the nineteenth century. Given the dramatic growth of both population and literacy during the nineteenth century, this may well be a fair proportion, but it illustrates the added difficulty of recovering the reading experience for earlier centuries.

The point of the preceding is not to criticize the *RED*; the problem does not lie with the database’s creators or methodology, but with the limitations of the evidence that exists. Nor is the point to argue for throwing up one’s hands in despair; it is, rather, that gauging audience response, particularly for periods before the twentieth century, requires creativity and imagination. Nicholson (2012) illustrates the degree of judicious inference that a sensitive researcher can bring to this task; if the archival record does not explicitly tell us how British readers consumed American jokes, the topic with which he or she is concerned, it is nonetheless possible to draw tentative conclusions from the information that is available about readers and the culture in which their reading took place.

Case Studies

Having described in general terms the task of researching and writing media history, the remainder of this chapter will examine two books that are among the most impressive recent works in British media history, Adrian Bingham’s *Family Newspapers?* (2009) and Laura Beers’s *Your Britain* (2010). Both scholars primarily identify themselves as historians of modern Britain who have an interest in the mass media, rather than as scholars of the media who have employed historical methodologies; both were trained in history departments, in the United Kingdom and the United States, respectively. Beers’s book is her first, based on her PhD dissertation, while Bingham’s is his second.

Bingham’s *Family Newspapers?* examines the coverage of sex in twentieth-century British popular newspapers. It is chiefly a work of content analysis, resting on the assumption that the popular press both influences and reflects public opinion – though Bingham wisely avoids drawing conclusions on either score that are more ambitious than documentary evidence can justify. This, in turn, divides into two methodological points. First, even if it is oversimple to imagine that readers simply change their opinions as a result of reading a single article, repeated readings are bound to have a cumulative effect on readers’ views. Although Bingham is unable, because of the limitations of available sources, to prove this through direct evidence concerning reader response, he is on solid theoretical ground here (see, for example, Calavita, 2005). At the same time, the commercial context in which the twentieth-century popular press operated insured that editorial content was shaped by readers’ expectations – though Bingham, naturally, does not argue that editors and journalists

were straitjacketed by their readers. Rather, this two-way relationship between mass circulation newspapers and their readers serves as the methodological underpinning of using a content analysis of these papers as a window into the understandings of sex within twentieth-century British culture.

Bingham's topic is a large one, and so the question of how to organize the material is particularly important. Rather than taking a strictly chronological approach, he organizes his discussion according to six topics, including sexual advice, surveys of attitudes and behavior, court reporting, moral crusades, titillating content, and portrayals of celebrities' sexuality; each of these topical chapters is itself arranged chronologically, emphasizing change over time. There are trade-offs between taking either a thematic or a chronological approach. A chronological approach would have been unwieldy, given the vast amount of material. In addition, the changes over time in these six areas did not necessarily follow the same chronology, and trying to arrange the book chronologically might have led Bingham to miss these nuances.

On the other hand, the danger in arranging this study thematically is that it compartmentalizes newspaper content in a way that does not match the readers' experience of engaging with a newspaper. In other words, a reader might move quickly from one type of content to another – and not only sexual content, but sport, political news, and others. Focusing on discrete themes risks, then, missing the interplay between different types of content. Bingham's solution to this challenge is twofold. First, he frames his discrete analyses within a thorough contextualization, based on a mastery of secondary literature, of changes in the framework of the popular press, and of the nature of British sexuality. This allows his readers to understand how his content analyses relate to the wider cultural history of twentieth-century Britain. Second, he makes frequent connections between the themes of his separate chapters. This reminds readers that the thematic divisions are analytical conveniences, and that the various sections of the newspapers worked together in effecting cultural change.

Although there are pros and cons of organizing his book in a primarily thematic rather than a chronological framework, such a choice is unavoidable. What Bingham accomplishes through his thematic organization, combined with the measures he takes to counteract the risk of fragmentation, is to allow him to make nuanced generalizations about the changing representation of sexuality within the popular press. In his conclusion he is able to aggregate the changes depicted in separate chapters, showing that although the transformations occurred at an uneven pace, on balance many of the loosening of attitudes often attributed to the "permissive" 1960s in fact had made their way into the popular press by the 1940s and 1950s. He is also able to show that across several different themes, newspapers attempted to use sex as a way of increasing circulation, while still remaining within the boundaries of a "family" newspaper.

Bingham's book also illustrates the value of using archival sources to frame content analyses, as well as the limitations of the archives. Various unpublished documents on which Bingham draws show readers' views of newspaper content, governmental policing of the boundaries of public decency, and management concerns about suc-

ceeding in a competitive commercial environment. This use of archival material immeasurably enriches Bingham's content analyses, making it possible to gain a sharper understanding of the conditions of production and reception. At the same time, to return to a theme discussed earlier in this chapter, Bingham is limited by the evidence that is available. Not every question he might have is answered. He notes, for example, that *The Times* and the *Guardian* have far more comprehensive editorial archives than most of the mass circulation papers he is examining, while evidence pertaining to reader response is particularly spotty. The latter is true even in the case of the archive of Mass Observation, the social research organization founded in 1937 to record British daily life through open-ended interviews with "representative" Britons.

Whereas Bingham's book is best described as a work of cultural history, Beers's *Your Britain* contributes most importantly to political history. In particular, it employs archival research to interrogate the long-standing left-wing view in Britain that the capitalist-owned press prevented the emergence of a Labour government in interwar Britain, one that otherwise would have naturally followed from universal suffrage. In the first instance, Beers is addressing political historians interested in the political transformations of the late nineteenth and early twentieth centuries, but who have largely neglected the role of the mass media (Beers, 2012). Like Bingham's study, then, Beers's speaks to concerns that were already prominent beyond media historians; like Bingham, she uses a substantial amount of primary source material to address such concerns in original ways.

Beers concentrates most heavily on policy history. Among her research questions, several predominate. Specifically: How did the interwar Labour Party move beyond its assumption of a hostile press in order to attempt to improve its coverage? How did the party seek to shape coverage on BBC programming, taking advantage of a new medium over which a single company held a legal monopoly? How successful was the party in shaping its media image? To what extent did the party have to change its platform in order to receive more favorable coverage?

Given the importance that interwar Labour Party leaders and leftist intellectuals attached to the media, it is not surprising that Beers is able to find a significant amount of archival material through which she can examine the party's efforts. She combines party records with material from the Conservative Party archive; the private letters of leading politicians of all parties; the archives of the BBC, the Trades Union Congress, Mass Observation, and such British state offices as the Foreign Office, Home Office, and Treasury; and political posters and published primary sources. She supplements this deep archival focus with a modest amount of content analysis.

Like Bingham's study, Beers's combines thematic and chronological approaches. In contrast to Bingham's, though, her book's organization is more heavily chronological, befitting a book whose subtitle emphasizes the "making of the Labour Party." In contrast to political historians who have attributed Labour's 1945 electoral landslide almost entirely to the experience of World War II, Beers shows that the party

began transforming itself from a working-class party to a national reformist party during the interwar period, largely through its engagement with the press and broadcasting.

Both of these books highlight a point with which this chapter began: that the best works of media history address well-defined analytical research questions through extensive primary source scholarship. They are not “media-centric,” but examine the media in larger contexts, whether political, cultural, economic, or social. They also illustrate that even the best media history will remain to some extent tentative and speculative, in deference to the limitations of the sources that are available.

NOTE

- 1 In addition, this chapter focuses on practical questions concerning historical research in media studies. For theoretical examinations of this topic, see Brügger, 2002; Nerone, 2003; Schudson, 1991; and Chapter 16 by Richard K. Popp in the present volume.

Film Analysis

James Walters

ABSTRACT

Critical attention to the close analysis of film has grown steadily since the turn of the century, with a number of recently published titles making it their central focus for discussion. In turn, analysis itself has enjoyed a resurgence in contemporary film studies, resulting in a number of key titles that make precise scrutiny a defining critical approach. When reflecting on these trends, we are entitled to ask what is involved in the detailed analysis of film: what challenges and rewards are represented in this critical practice? With these questions in mind, this chapter explores processes of analysis through a series of examples from film studies. In building a picture of the various forms and approaches, the discussion seeks to evaluate the enduring centrality of detailed analysis in contemporary film studies.

Film analysis is one of the most if not *the most* prevalent of academic methods in film studies today. Examples of film analysis can be found across a whole spectrum of writing on topics within film history, theory, and criticism. It is to be expected that this kind of ubiquity might lead us to take film analysis for granted and, as a consequence, that we may neglect to reflect upon what we think we're doing when we analyze films. Certainly, the range and diversity of writings that fall under the general banner of "close textual analysis" in film studies suggests that many different people interpret the term in many different ways. Film studies has never settled upon one

uniform method of analysis and it certainly is not the aim of this chapter to propose a defining approach. Indeed, there may be great benefit in having varying methods of analysis and, in any case, there are obvious points of convergence between approaches as much as there are distinctions. Neither am I concerned with detailing *all* of the analytical approaches to be found in film studies or to give an especially historical account of their development. Rather, what follows is an evaluation of a few different approaches, all of which I take to be important within film studies.

Introducing Film Analysis

It is a common, perhaps universal, practice for film studies courses in colleges and universities to feature some element of film analysis within the curriculum. Students are often introduced to the rudiments of analysis from the outset – as part of a first-year module, for example – and this tendency is indicative of a general acceptance that film analysis occupies a central significance in the study of the medium. This acknowledgment is shared elsewhere. Many “introduction to film studies” textbooks have been published over the past 40 years and all of them devote significant passages to the topic of film analysis. In common with university and college courses, this frequently happens right at the beginning. It is uncontroversial to suggest that, of the plenitude available, David Bordwell and Kristin Thompson’s *Film Art: An Introduction* is the textbook that has received the most widespread use. Its ubiquity ensures that, for many students, the text may come to represent the key introduction to the principles of film study. The book has been reprinted in a number of editions since its first publication in 1979 and, given the breadth and diversity of contemporary film studies, it is notable that a particular approach has endured in each cycle of publication.

In adherence to the thrust of the book’s title, the authors dedicate themselves to a conviction of film as art and, as one would expect, this becomes a guiding influence throughout chapters. Such assertions are perhaps unremarkable and represent no more than the reasonable expectations we might hold of this particular text. However, Bordwell and Thompson’s methods for demonstrating the medium’s status as an art form are striking, and of preliminary relevance to this chapter’s concerns. As early as page 3, in a section proposing to focus on creativity, technology, and business, we are given a brief but fairly detailed analysis of a sequence from Alfred Hitchcock’s *Shadow of a Doubt*, complete with a number of accompanying frame enlargements from the film. The following segment is representative of this analysis, with the numbers in parentheses referring to frame enlargement illustrations:

The director of *Shadow of a Doubt*, Alfred Hitchcock, believed firmly in using the medium to arouse the viewer’s mind and feelings. So, as Uncle Charlie launches into his monologue, Hitchcock presents us with a shot of the entire table (1.3). We’ve seen

something like this shot in earlier scenes, and it orients us to the positions of the scene's major characters. At the same time, Hitchcock arranges things so that Uncle Charlie, not Emmy's husband, sits at the head of the table. His domination of the household is presented visually. As Charlie starts to talk, after a shot of Emmy, we get a brief shot of Little Charlie, eyeing him anxiously (1.4). When he begins to denounce the "useless women," we get a close view of him as he continues his attack (1.5). (Bordwell & Thompson, 1979/2010, p. 5)

The discussion of *Shadow of a Doubt*, and of this sequence, contributes to the book's general introductory point about the ways in which film style – and particularly visual style – can become representational strategies in film. In this instance, the authors propose that Uncle Charlie's dominance is asserted through visual composition (and it is this dominance that will develop to become ever more sinister as the film progresses). If we can get beyond the bluntness of the language (we might ask which director *doesn't* seek to "arouse the viewer's mind and feelings") that is surely designed to avoid taxing or troubling the novice film student, we can appreciate that Bordwell and Thompson place analysis at the heart of their introduction to film as an art form.

An effort is made to stay close to detail from the film, a fact illustrated in the relating of thematic points to shot compositions and also in the inclusion of numerous frame enlargements that elaborate these relationships. For the individual starting out in film studies with Bordwell and Thompson, the first method that will be encountered is a version of detailed film analysis. It follows that the authors place film analysis at the center of any introduction to the medium and, furthermore, this strategy demonstrates the extent to which they are not prepared to simply take for granted (or ask the reader to take for granted) that film is an art form capable of meaningful expression. Rather, they commit themselves to laying out in step-by-step detail the ways in which a single scene can achieve such an effect. This approach defines the whole of *Film Art* and, indeed, Bordwell and Thompson round off their analysis of *Shadow of a Doubt* in the following way:

The rest of this book will examine the ideas of form and style more closely. Here we just want to suggest that our *Shadow of a Doubt* scene is typical of how cinema works as art. Films have subject matter and themes that contribute to the artistic effect, but in themselves those amount to raw material. We have plenty of films about serial killers, but how many as vivid as *Shadow of a Doubt*? It's through form and style that film draws us into a moment-by-moment engagement, just as a song or a play or a novel does. As a film unfolds in time, it offers a developing pattern that encourages us to ask why things are happening and to wonder what will happen next. We feel curiosity and suspense and surprise. The film engages our vision and hearing, our knowledge of the world, our ideas, and our feelings. The filmmaker can create a structured experience that will involve us keenly – and sometimes change the way we think and feel about our lives. After watching *Shadow of a Doubt*, many viewers ask whether the world is as sunny a place as it sometimes seems. (Bordwell & Thompson, 1979/2010, p. 7)

Some key themes emerge within this account of the book's analytical approach. The use of phrases like "how cinema works," "raw material," and "structured experience" reveals a view of film as something relatively mechanical and process-driven. It's entirely feasible to see the advantages of this attitude in the context of the book that Bordwell and Thompson have intended to write: their account of cinema allows the medium to remain manageable and, perhaps, appealingly linear for the uninitiated reader. Laying out a series of clear processes, especially ones that might extend across the whole of cinema, has obvious benefits in this context. The kind of analysis that Bordwell and Thompson engage in treats cinema as a series of constituent parts that can be taken apart, looked at, and then put back together again: rather like the components of a car engine or bars of a musical score. *Film Art's* achievement lies in its desire to retain relentless clarity as it performs this task of "taking apart," its authors ever conscious not to lose the reader by making matters too convoluted or ambiguous. A second achievement is to keep the reader oriented precisely by staying close to detail from the films and, where possible, giving visual illustrations of the points raised. In this way, Bordwell and Thompson respond to their notion of film drawing us into "a moment-by-moment engagement" by undertaking moment-by-moment analyses of sequences, scenes, and sections.

It is perhaps understandable that an introductory text such as *Film Art* would strive for simplicity and linearity in its analysis. However, there are some inevitable drawbacks contained within such an approach. First and foremost, we might question whether analysis of this kind best responds to the complexity of the medium. Although sections of the book are devoted to shot-by-shot detail, it is notable that the resulting analysis often concerns itself with surface effect. This is most apparent when the discussion of *Shadow of a Doubt* moves to an evaluation of the film's impact upon the viewer. It is indisputable that hypothetical audience members might be moved to question whether their "world is as sunny a place as it sometimes seems" having watched Hitchcock's film, as Bordwell and Thompson suggest. The understatement inherent in this remark is effective as a witty reflection on Hitchcock's cinema (it is difficult to think of a film from his *oeuvre* that *doesn't* depict the world as slightly less than sunny). And yet, as the only evaluation offered, this assessment is unusually brief and purposely avoids engaging in any great depth with any of the film's various undercurrents and tensions. We are perhaps entitled to ask whether *Shadow of a Doubt* can really be summed up this easily. There is an imbalance, therefore, between the protracted nature of the analysis undertaken ("moment-by-moment engagement") and the brevity of the evaluation that is reached. If the processes of analysis are made clear in *Film Art*, the purpose of analysis is left ambiguous. We might conclude that the approach demonstrated takes the film apart but then puts it back together a little too quickly, too neatly, and, in the process, risks reducing its qualities to a somewhat facile defining message (the world may not be as sunny as it seems). The method is then defined by its reductionist stance and, indeed, we might regard Bordwell and Thompson's contribution as a kind of reductionist analysis.

How far we take these criticisms of Bordwell and Thompson's analytical approach depends upon our view of *Film Art* as an introductory text, and of what an introductory text should aim to achieve. On the one hand, we might defend the book's stance by, quite reasonably, drawing attention to the fact that students of film are likely to encounter analyses that are far richer, more sophisticated, and greatly complex as they develop a sustained engagement with the field (some of them written by Bordwell and Thompson, perhaps). From this perspective, *Film Art* usefully introduces them to one method of analysis with, perhaps, the plausible expectation that the reader will move beyond the reductionist approach it embodies. On the other hand, we can speculate that this introduction to film analysis risks starting students off on the wrong foot precisely by not taking analysis to the point of meaningful evaluation. It should be added that, embedded in Bordwell and Thompson's analysis of *Shadow of a Doubt*, there are moments of evaluation and critical assertion: the observation that very few serial killer films are as "vivid" as Hitchcock's provides a clear initial statement of *Shadow of a Doubt's* value in the authors' eyes. As such statements are not capitalized upon, however, the reasons for conducting an analysis of this particular film may remain enigmatic.

Film Analysis and Criticism

Reservations of the kind potentially leveled against *Film Art* derive from the close relationship that exists between film analysis and film criticism. In their book, *The Language and Style of Film Criticism*, Alex Clayton and Andrew Klevan "characterise film criticism as a form of writing which addresses films as potential achievements and wishes to convey their distinctiveness and quality (or lack of it)" (Clayton & Klevan, 2011, p. 1). This distinction is useful not only in terms of emphasizing the central strength of the author's voice in film criticism but also in laying out a series of reasons why film criticism might be pursued at all. Following on from this, and in relation to film analysis, they suggest that

It is felt, perhaps, that serious academic analysis should differentiate itself from the evaluative reactions of the ordinary film viewer – "he's really good in this," "this is definitely her best film" – or that "opinionated" newspaper reviewer. For the most part, films are used illustratively (valued primarily for their usefulness) rather than engaged with critically (valued for their achievements). (Clayton & Klevan, 2011, p. 2)

We might easily recognize Bordwell and Thompson's analytical approach to *Shadow of a Doubt* in this characterization. However, rather than necessarily seeing this only as a failing on the part of the authors, we might acknowledge that there is a genuine hesitation in *Film Art* over whether and when it is *appropriate* to offer critical judgments. Although it exhibits some of the central traits, Bordwell and Thompson's

book does not automatically share the perceived prejudices of “serious academic analysis” that Clayton and Klevan describe. On the contrary, the analysis undertaken in *Film Art* seems to hold the modest assumption that strongly asserted film criticism may not be useful or helpful to the uninitiated reader taking their first steps in film studies. It might be said that, rather than forcing their own critical agenda, Bordwell and Thompson are especially anxious about the reader’s experience. As a result, critical judgments are used cautiously in the book, emerging as brief comments or phrases, but rarely sustained or elaborated. In this way, and with perhaps admirable intent, *Film Art* dedicates itself to the process of analysis but, for the most part, suspends any subjective assertion as to why such analysis might be undertaken in the first place – how it might enhance an appreciation of a film’s value and achievement, for example.

If Bordwell and Thompson’s suppression of their critical perspectives is to be viewed as modest, as I suggest above, then we might be led to conclude that their intentions are commendable: that they want to help the reader as much as possible. Yet, we also have to concede that the endeavor brings with it some oddities, not least the fact that the analysis of *Shadow of a Doubt* occurs as part of an opening subsection entitled “Film Artistry.” If the admirable boldness of that titled statement is not addressed or pursued in the proceeding analysis, how then is the reader to understand what Bordwell and Thompson mean by “artistry” as opposed to, say, “competence”? Again, why analyze this film at all?

Alex Clayton draws attention to further, and more essential, issues with *Film Art*’s approach, however. He identifies Bordwell and Thompson’s tendency to reduce films down into cause-and-effect chains and goal-centered narratives within their analysis of Howard Hawks’s *His Girl Friday*. Having illustrated a series of difficulties associated with these strategies, Clayton offers a crucial assessment:

What Bordwell and Thompson cannot escape is the fact that any descriptive word choice necessarily embodies an interpretative stance. The phrase “initial goal,” chosen primarily to recap the paradigmatic vocabulary advanced elsewhere, has nonetheless been picked from an available range of potential descriptions which might have included “vague wish,” “heartfelt desire,” “ill-defined plan” and “cover story.” Each would construe Hildy’s [the film’s lead female character, played by Rosalind Russell] situation in a slightly and significantly different way. (Clayton, 2011, p. 32)

We might say that Clayton’s point relates not only to Bordwell and Thompson’s descriptive approach but also to the way in which all analysis is inescapably fused with interpretive criticism. Every analysis undertaken represents a choice or series of choices made on the part of the analyst. Indeed, Bordwell and Thompson’s brief analysis of *Shadow of a Doubt* is a demonstration of a particular critical perspective being adopted and offered to the reader. They make the point that

Everything that occurs in a film is affected by context. Sometimes we pull out a moment for study, as we’ve done here. But to get the full effect of that moment, we

need to see it as part of the whole movie, from beginning to end. Any film has an overall organization, what we'll be calling its form. Calling it a form suggests that a film isn't simply a cluster of moments. It's a pattern. *Shadow of a Doubt* is organized as a story, and the dinner scene we've been examining contributes mightily to the progression of that story. It serves, we can say, a formal function. (Bordwell & Thompson, 1979/2010, p. 4)

The choice of the phrase "formal function" in the final sentence of this passage might implicitly mask the process of critical selection that the authors have undertaken. A potential strength of Bordwell and Thompson's focus on this moment from *Shadow of a Doubt* derives from their opening contention that the scene is "powerful" (Bordwell & Thompson, 1979/2010, p. 4). It is reasonable to speculate from this and from their ensuing analysis that, for the authors, the moment is pivotal and has qualities that are exceptional within this film's pattern of exceptional moments. Putting the moment back into its overall context (the whole film) is entirely logical, but care perhaps needs to be taken in order to avoid characterizing it as one moment in a pattern of *equal* parts within a film's "overall organization." Bordwell and Thompson's analysis actually suggests that this moment is remarkable not only for its coherence with the film's overall organization, but also because of its distinctiveness – its power. Crucially, the moment also reinforces the authors' interpretation of the film: their evaluation of its dramatic goals and achievements. Yet, when that fact is subdued or avoided, even in an introductory context, the vital connection between analysis and interpretation is left ambiguous. A potential consequence of characterizing film analysis as objective rather than subjective is that opportunity for disagreement, dispute and, most importantly, engagement are curtailed. This holds implications for any text, but particularly one seeking to tutor students in the principles and procedures of film analysis. An alternative, therefore, is to view analysis as an inherent articulation of a critical position: a reading of a film.

Film Analysis and Systems

If analysis is always the product of interpretation, it can also be a way of organizing a film's audiovisual data, and of organizing our responses to that data. In a key essay that deals with the work of film analysis, Raymond Bellour (2001) outlines why, for him, such a process of organization might be important but also difficult. He compares film to literature and notes that

the text of a film is unattainable because it is an unquotable text. To this extent, and to this extent only, the word text as applied to film is metaphorical; it clearly pinpoints the paradox that inflicts the filmic text and to such a degree only the filmic text. (Bellour, 2001, p. 22)

Bellour's notion of film's special status as the "unattainable" text is striking because, quite clearly, it eloquently captures the potent intangibility of the medium. Furthermore, his choice of the phrase "unquotable text" is pertinent in that it addresses directly the challenges presented by film analysis: to translate the audiovisual form into written form without losing the shape and meaning of the original artifact. Bellour (2001, p. 25) expands on this point when he describes the moving image as paradoxical:

On the one hand it spreads in space like a picture; on the other it plunges into time, like a story which its serialization into units approximates more or less to the musical work. In this it is peculiarly unquotable, since the written text cannot restore to it what only the projector can produce: a movement, the illusion of which guarantees the reality. That is why the reproduction even of many stills is only ever able to reveal a kind of radical inability to assume the textuality of the film.

On a historical note, it may be worth pointing out that Bellour, who wrote his essay in 1975, is describing a standard of analysis that predates technologies such as video and DVD. So, as he concedes, "unattainable" text is a play on words: sometimes it was just very difficult to obtain the material film and find the facilities that would allow for close analysis to take place at all. (Perhaps one of the unanticipated pleasures of Bellour's writing is his modest acknowledgment, at various points in his essays, of the necessary fallibilities in sections of his analysis due to such practical and technical limitations.) But, even as technology has advanced beyond editing tables and 16 mm Steenbecks, and even as films have become so widely available that acquiring a copy can often involve only a simple Internet search, Bellour's evocative description of the film text as unattainable even as we attempt to capture it, escaping from us at the very moment we strive to reach it, stands the test of time. It would be hard to miss the poetry of Bellour's words (translated, in this instance, from the original French by Ben Brewster) and we might also note the underlying sense of responsibility to the medium that he expresses as he describes the profound frustration – the "radical inability" – of the film analyst and the methods they employ. In returning to that challenge time and again, Bellour exhibits his dedication to film.

Given his contention that the film text is inherently unattainable, it is useful to note some of the ways in which Bellour approaches the task of analyzing that text. Bellour opts to deal with films in segments, isolating specific scenes or sections of scenes for especially rigorous extended analysis. This technique often involves lengthy portions of shot analysis, which are always accompanied by especially large quantities of frame enlargements and which frequently detail repetitions and variations in visual style. Sitting alongside these breakdowns are passages of interpretation – what Bellour takes to be important within the section offered for extensive analysis. This fluctuating pattern of analysis and interpretation is not uncommon in film studies, and yet Bellour's work is noteworthy for the extent to which it places divisions between the articulation of a segment's function and claims for its meaning and significance. So, for example, when discussing a sequence from *Marnie* (it is the scene

in which businessman Mr Strutt has discovered that Marnie has stolen \$10,000 from him, before he is interrupted by the arrival of a wealthy client, Mark Rutherford) Bellour begins with a line-for-line quotation of the film's script, followed by a shot-by-shot breakdown (accompanied by a number of frame enlargements) before going on to discuss the words and images almost completely in isolation (Bellour, 2001, pp. 219–223). There is meticulousness to Bellour's method here: we are presented with an extensive section of the script (running to 31 lines) and every one of the 24 shots is accounted for in the proceeding description. A clear benefit of this approach is that we are given a great deal of data to contemplate and digest as Bellour moves through his analysis. In this sense, we might well conclude that the approach is admirably rigorous. And yet, he lays out all of this information in order to move to a single, albeit potent, point:

Once the dialogue has ended and the camera has completed the slow forward tracking shot that isolates Mark's face, he turns towards the spectator with a thoughtful look that is obviously supposed to indicate that, during the time when the shot becomes stationary, he is daydreaming about this woman whose virtual image he has helped to create. The real image that follows (25a) repeats exactly the beginning of shot 1 [a closeup view of Marnie's clutch bag from behind as she walk along a station platform] and seems to materialize his pensive gaze, taking the place of the traditional subjective shot . . . Mark thus sees what he cannot see but what he is in the position of being able to imagine by means of the camera that sees in his place. This repetition-effect, which makes Mark see/imagine what Hitchcock—the camera sees in shot 1, situates Mark on the trajectory of enunciation permitted by the camera-look. Mark's singular desire for Marnie is aroused by this relationship between himself and the image. He becomes the relay for that which Hitchcock can only possess through the camera, which forbids it to him precisely so that he may represent it. The fetishistic operation, thus redoubled, is extended from the director to the character who takes his place, which brings about a return to the narrative's initial condition of possibility: the essentially fetishistic position of the cinematographic signifier. (Bellour, 2001, p. 222; numbers in parenthesis indicate frame enlargement illustrations)

If we accept Bellour's reading of Mark's expression as functionally situating the character on the "trajectory of enunciation permitted by the camera-look," then we are also entitled to wonder why he deems it necessary to reproduce the dialogue from the *entire* scene as well as account for *every* shot contained within its composition. We might suggest that Bellour's dedication to an especially painstaking, especially close, model of textual analysis has not only unnecessarily delayed the delivery of his crucial point but also distracted him from the critical task of articulating that which is crucial: editing out peripheral detail in order precisely to focus our attention upon the most important data. It is perhaps an adherence to taking everything in sequential order – as part of the segment's shot-by-shot progression – that restricts Bellour's critical options in his reading of the moment. One alternative available to him is to begin the analysis at the segment's end – with Mark's look and the

transition to Marnie's bag. But, of course, that would disrupt the methodology at work in Bellour's analysis and risk undermining a central thesis of sequential development in Hitchcock's films. And so the reading is left critically unbalanced but chronologically correct.

In fact, there is a further issue with Bellour's reading of the sequence. In detailing every line from the scene, he is obliged to include a key interjection delivered by Mr Strutt's secretary:

OTHER COP: *What were her references?*

STRUTT: *Well, as a matter of fact . . . yes, she had references, sure . . .*

SECRETARY: *[Oh] Mr Strutt, don't you remember, she didn't have any references at all.*

(Bellour, 2001, p. 219–220)

The secretary's sardonic prompt is expertly timed within the sequence, coolly deflating and frustrating Strutt's attempts at gaining the moral high ground as well as rewarding one of the cops' stifled guffaws from seconds earlier. It builds on an earlier shot of the secretary lowering her eyes and smiling knowingly as her boss launches into an elaborately lascivious description of Marnie. Beginning her sentence with "Oh" (a detail that Bellour can be forgiven for omitting) gives the line a *faux* innocence that delicately emphasizes this woman's intellectual superiority over her boss in this moment.

The irony of Bellour's reading is that, although he gives us the secretary's line, includes her in the shot breakdown, and actually features her in the selection of frame enlargement illustrations, he does not once mention her significance within the scene. This seems important, given the conclusions that Bellour reaches. If Mark takes Hitchcock's place in the "fetishistic operation," what function does the secretary – the lone female character within the scene – have and, more importantly, what might her role be in relation to the director of this film? One possibility might be that she also embodies the director in some way, straining against that very operation of fetishism which Bellour identifies. At the very least, the character provides some balance to the scene, which should be noted in the light of such a strongly asserted theoretical reading. However we choose to interpret the role of the secretary, we may be entitled to conclude that her omission from Bellour's analysis is curious and, even, that it risks undermining the stringency of his approach as well as the strength of his critical interpretations.

Driven, perhaps, by his founding definition of its unattainability, Bellour commendably attempts to achieve an unusually close proximity to the film text in his analyses. His reliance upon frame stills and, elsewhere, his inclusion of detailed diagrams and tables demonstrates his desire to take the medium apart in order to understand it better, and presumably to help us understand it better too. And yet, it might be that the approach carries with it a warning. Although it is only one small example of Bellour's method, in his analysis of the segment from *Marnie* he appears to have sacrificed perspective in the pursuit of proximity. We are left to conclude that

systematic accuracy, of the kind Bellour pursues as he enters stills and segments into tables like fiscal statistics, can only be worthwhile if it is combined with critical precision. Ironically, in getting as close as possible to the film's material, potentially pivotal moments can be lost. It might be a little harsh to suggest that Bellour's freezing of frames and cataloging of shots deadens the cinema he cherishes, but it is certainly the case that the process risks constraining the flows and rhythms of the medium. This can lead to certain elements being missed entirely: Alfred Hitchcock's sense of humor, for example.

Film Analysis, Statistics, and Objectivity

If the claim that Bellour's approach "deadens" cinema is made tentatively, then Barry Salt's assessment of the French theorist's work carries with it no such inhibitions. For Salt, in his book *Film Style and Technology: History and Analysis* (1983/2009), all interpretive models of film theory and criticism merit thorough re-examination. Indeed, in his chapter "The Interpretation of Films," he explains that:

The question of what should count as valid interpretation of a film or other work of art, and why it should, is one that most people do not seem willing to face. For brevity we can consider the alternative positions on this question as being stretched out along a spectrum from the most conservative or restrictive position to the most extreme or radical. At the restrictive extreme the possibility of true, or at any rate fairly certain, interpretation is denied altogether, and at the other extreme all interpretations, however generated, are regarded as equally valid. In between these two extremes are various positions where smaller or larger numbers of different systems of interpretation are considered to be valid. There is also a tendency for the amount of unjustified personal intuition used by the critic or interpreter to increase towards the more radical end of the spectrum. (Salt, 1983/2009, p. 16)

Thankfully, and perhaps rather conveniently for his argument, Salt immediately dismisses the "most . . . restrictive position" from his discussion, stating that anyone denying valid interpretations but still producing interpretations is "wasting everyone's time" (p. 16). We should perhaps be relieved that this odd position is not explored in depth, but we might also wonder whether Salt would struggle to find a significant number of critics and theorists adopting it in order for it to exist as a recognized position at all. The obvious contradictions inherent in such a position would surely discourage anyone from articulating it and so, perhaps, Salt is speaking of a hypothetical stance, rather than a literal one. Nevertheless, he finds evidence for the second, more radical position in lots of places, and arrives at Raymond Bellour.

Before reaching Bellour, however, Salt does advance a couple of rather odd views about film interpretation. For example, he raises the notion of all interpretations being equally valid, in his view often cited as a justification for the most "extreme"

interpretive position. In countering this, he refers to the fact that, although many artists and filmmakers claim that their work “means whatever a member of their audience wants it to mean,” they nearly always reject those interpretations. This seems to partially evoke Roland Barthes’s famous assertion that “the birth of the reader must be ransomed by the death of the author,” but Salt goes on to give the example of filmmaker Andrei Tarkovsky:

Although he has sometimes said to enquirers that his films mean whatever they mean to the individual person watching them, when it was suggested that the mother in *Zerkalo* was an unloving mother, he instantly rejected this, as he did other interpretations which he didn’t agree with. (Salt, 1983/2009, p. 17)

No reference is given for this exchange and so we have to take Salt’s word for it. Nevertheless, the issue here is that his example doesn’t necessarily dispute artists’ claims that meaning belongs to the audience or, rather, that they have the most significant role in its interpretation. It would be a very stringent application of Barthes’ “Death of the Author” essay that required Tarkovsky to remain entirely silent on his films’ meanings once they had been exhibited to the public. Rather, it seems that, in Salt’s example, the director is merely responding to his work as an active audience member, and giving his interpretation of the film accordingly. His status as the film’s director does not necessarily close off all other interpretations or mean that a definitive interpretation has been provided. A position has been articulated that can be accepted or rejected. Its validity will perhaps depend upon the justifications offered for such a strongly asserted judgment being advanced.

In this way, Tarkovsky enters into a fluid interpretive process that, if nothing else, has the potential to include. There is the suspicion that this kind of fluidity would not find favor with Salt as, throughout his study, he bemoans the ambiguity inherent in most film interpretation as opposed to more scientifically rigorous approaches. Indeed, on the topic of film perception, he proposes that scientists will one day take over from “theorists” sitting in armchairs in the humanities departments of universities and that this will be an immensely more favorable state of affairs (Salt, 1983/2009, p. 33). As Salt moves through the major models of film analysis and their founding theories (from the 1970s mainly, given the book’s original publication date of 1983) very few figures remain standing. Althusser, Lacan, Greimas, Eco, Metz, Lacan, and other eminent names are taken to task in a fairly uncompromising style. Readers might welcome Salt’s refreshing dismantling of certain theories that, when his book was published, were almost unassailable in certain corners of film studies. Certainly, the directness and forcefulness of Salt’s criticisms were rare at the time and it still remains a rarity for such attacks to appear in academic books today.

Salt’s account of Bellour’s analytical approach is no less caustic. He takes Bellour’s famous use of diagrams to demonstrate movement in *North by Northwest*’s crop-dusting sequence as an opportunity to define these methods as “meaningless” (Salt, 1983/2009, p. 18). His technique for exposing this meaninglessness is audacious and

effective: Salt constructs his own set of diagrams comprising completely random data (one diagram is “constructed by drawing a pair of axes, and then dropping ten pins which fell onto the sheet in the marked position”) and uses them to reach the same conclusions as Bellour, thus highlighting the proposed futility of the approach. In one section, he concludes that:

The fact that my interpretation, though based on a meaningless diagram, is indistinguishable in its nature from Bellour’s interpretation demonstrates the pointlessness of his approach, and I could produce the same kind of interpretation for an infinite number of arrangements. (Salt, 1983/2009, p. 18)

It is worth noting that Salt’s engagement with Bellour’s methods of analysis is fairly brief and, as a consequence, it is hard to gain the sense that a comprehensive account of the latter’s analysis of *North by Northwest* is being sought. Nevertheless, the nature of his criticisms recalls reservations we have had about Bellour’s work, namely that his attempt to get as close as possible to the medium he analyses in some ways ironically draws him away from it. The *North by Northwest* diagrams (like the frame enlargements and tables) might represent an attempt to organize the data of the film and to retain an engagement with it as part of the analysis but, as Salt asserts, that very process potentially transforms the film’s data to such an extent that it risks becoming an erroneous account of *North by Northwest*’s climactic scene.

However, we might legitimately question whether the fact that Bellour’s analysis can be made to fit different diagrams of Salt’s (random) design necessarily undermines the validity of his overarching analytical approach. The diagrams are a means for Bellour to visually underpin the analysis he undertakes and, while we might concur with Salt that they are not flawlessly constructed, we would have to consider quite carefully whether the flaws are fatal. Furthermore, Bellour’s analysis of *North by Northwest* is multifaceted and its fluency is variable; I am sure that many would suggest Salt is simply misrepresenting it in his brief account. For Salt, though, there are no such concerns: Bellour is a charlatan, like so many other film theorists.

Given the force with which Salt dismisses a series of prevailing analytical models, we might naturally be curious to discover what alternative method he proposes. Salt states that analysis of film can proceed in two directions:

Most importantly, films can be analysed in terms of their construction and their relation to their makers: analysis in this direction is mostly ignored in theorizing about film . . . Less importantly, films can be analysed in terms of the response of their spectators. Of course film-makers also form part of the audience, and they are the part that is capable of the fullest response and understanding. (Salt, 1983/2009, p. 25)

A clear priority in this explanation is the returning of the filmmaker to a position of greater authority within film analyses. This occurs at the expense of the “spectator,” and here we can appreciate that Salt seeks to discard not only film audiences (as he

later tells us, “the major part of film audiences probably understand film in a very simple way. In fact as an intensified and extended dramatic representation i.e., like a stage play with knobs on”) but also those professional spectators who, in his eyes, promote the worst excesses of film theory. In any case, for Salt it is the filmmaker who is most qualified to offer an informed response to a film, without reference to audiences or theorists. This alternative approach to analysis is manifested in Salt’s concentration on formal aspects of film style:

Questions of style arise when we consider films in relation to other films . . . The importance of formal style analysis is beginning to be realized, but it still has not got much further than remarking things like the fact that Howard Hawks keeps the camera at eye-level and doesn’t move it if possible. But in fact there are other directors of his vintage who do this too. For instance Henry Hathaway . . . The real stylistic distinction is that further than this, Hawks keeps his Average Shot Length a little longer than normal, whereas Hathaway uses faster cutting. (p. 27)

This passage introduces the process of considering films comparatively, which is a key method of Salt’s, and also an interest in statistical analysis that, among other things, can result in a recorded figure for average shot lengths in a film or across a number of films. (It should be added that Salt combines these approaches with an expert knowledge of cinema history and technology throughout his work.) The combination of these approaches leads him to the kind of information he lays out in relation to Hawks’s film. And yet, while we might agree that the observation about Hawks’s camera positioning and movement is fairly limited, it isn’t abundantly clear why the second point about average shot lengths should be treated as any more enlightening, despite the fact that it highlights a distinction rather than a similarity between two filmmakers.

Salt devotes immense amounts of time collecting data on average shot lengths, numbers of shots, and shot scales in films, and there are some interesting results here: for example, the generally held view that average shot lengths have decreased over time in Hollywood is given credence as these lengths are plotted on a year-by-year graph and a decline is recorded (Salt, 1983/2009, p. 378). It is not difficult to envisage how such background information could usefully underpin further historical research in film studies. Salt goes further, however, as he applies this statistical approach to a “stylistic analysis” of the films of director Max Ophuls. In keeping with the book’s overall methods, the stylistic analysis involves a breakdown of shot lengths, scales of shots, and camera movements in all of Ophuls’s films accompanied, on the face of it, by short descriptions of the films’ content and notable stylistic examples from them. This at least seems to have been the plan for the analysis, but we find the bland objectivity of the quantitative data clashing against the emphatic subjectivity of Salt’s own value judgments. We are told, in relation to *Letter From an Unknown Woman*, that

Taken scene by scene, the major deviations from the norm are pretty much what might conventionally be expected. For instance, the cutting rate is a lot faster than normal when Lisa hears Stefan playing, and then meets him for the first time in Scenes 5 and 6, and also when he picks her up and takes her for a meal in Scenes 22 and 24 . . . On the other hand, Ophuls gets his longest takes in the most emotionally neutral scenes, such as the promenade before church at Linz, which is Scene 18 in my dissection. (p. 392)

As with Salt's attention to average shot lengths in Hollywood cinema, it is quite conceivable that statements of this kind could provide useful background context for those wishing to conduct an analysis of Ophuls's work. However, if we are to take them as a version of analysis in its own right, we have to question whether they provide any striking insights regarding the films of Max Ophuls. If a statistical analysis of *Letter From an Unknown Woman* yields only facts like the director was able to complement his character's emotions in the pace of his editing, then perhaps that method serves the filmmaker poorly. As it happens, when it comes to the point of evaluating Ophuls's work, *Letter From an Unknown Woman* fares rather badly, way behind the non-Hollywood films and merely in among those made in the United States (it is not clear why or how we have got into this game of ranking Ophuls's films, although in fairness this is something certain studies of film authorship do from time to time). Salt concedes that some might contest these judgments but he provides his own defense:

Let them reflect that their strong personal preference for *Letter* may depend on personality factors which cannot be expected to be the same for everyone else. My purpose is to eliminate these subjective elements as far as possible, and I believe I have succeeded, since if I were proceeding by my own feelings alone I would rate the last three Ophuls films rather low. (Salt, 1983/2009, p. 398)

Here we reach Salt's overarching goal of evaluating film objectively, and thus avoiding the deficiencies subjectivity can cultivate in the work of others. And yet, there is the suspicion that, as this objective approach compresses the films into statistical data, it drains away their vitality and their interest. No wonder, then, that *Letter From an Unknown Woman* emerges as an unremarkable endeavor. The three criteria for evaluating a film to which Salt adheres are: "originality in all respects of the film," "the influence it has on other films," and "the degree to which a film-maker has fulfilled his intentions in the finished film" (p. 28). It is not clear why these criteria are chosen, and certainly each of the points are at least problematic in terms of drawing evidence-based conclusions.

Nevertheless, as Salt equates originality to matters such as the mean scale of shot distribution, a film like *Letter From an Unknown Woman* emerges as fairly unoriginal precisely because its formal style is characteristic. Not only is it characteristic of Ophuls's filmmaking (although we are also told that Ophuls has no consistent style)

but it is also typical of the romantic melodrama genre. On this theme, Salt in fact chides Robin Wood for his “over-interpretation” of the film (which occurs in chapter 5 of his book *Personal Views*), stating that the features Wood identifies and uses to underpin his arguments could be found in any number of similar films (Salt, 1983/2009, p. 389). Unlike Wood, Salt’s brand of statistical analysis avoids considering how directors use conventional structures (shot lengths and distances, editing rates, genres, plots, locations, etc.) expressively and in combination. One possible starting point for evaluating the achievement of a film like *Letter From an Unknown Woman* (and a good deal of other Hollywood films) might be to think of the ways in which it could conceivably have become a very conventional “genre” picture in the hands of another director. But if we never engage with the ways that Ophuls employs those conventions and finds new opportunities for expressive depth, if we rely only on lists and tables of the shots he employs, we are likely to fall short of a detailed engagement with the film’s achievements.

Salt’s desire for subjective evaluation is clear, but it is not pursued consistently in his book. Alongside the statistical analyses, we also have passages like this one about an early Ophuls film, *Komedi om Geld* (The Trouble With Money):

The film is more distinctive than most of the films Ophuls made in this period, and is the only one with a fully original screenplay, in which he himself had a large hand. Not surprisingly it is the worst constructed from the narrative point of view, with a quite pointless idyll for a pair of totally unnecessary young lovers shoved into the middle of the film, and a total and very apparent lack of logic in the resolution of the difficulties of the hero in the second half. The pacing of the later stages is also noticeably sluggish. These faults are not in the least overcome by the Brechtian presentation of the story by a clown compère in a circus set who comments in song at the beginning, middle and end. (Salt, 1983/2009, p. 387)

In fairness, Salt does proceed with some details about the film’s formal style, but the passage is characterized by the highly subjective series of value judgments being offered. It is hard to square paragraphs of this kind with the methodically objective statistical data that occupies Salt’s arguments elsewhere. A fracture is therefore created between moments of subjective critical discrimination and the more serious, possibly more sterile business of *analysis*. The problem for Salt’s work is that his impulse for the former keeps threatening to break through the rigorous neutrality of the latter, creating an integral imbalance. On the one hand we have a set of fairly arbitrary but methodically researched statistics about a filmmakers’ work, and on the other we have candid personal responses to that work. Neither seems adequate, especially since Salt proposes his methods of analysis to be the viable alternative for a whole galaxy of other theoretical and analytical approaches. Salt’s work has immense value not only for its expansive accounts of film history and technology but also because his data provides such a firm footing for anyone writing about film style. In that sense, it sits alongside rather than replaces those contributions the author finds to be “meaningless” or worse.

Film Analysis, Description, and Evocation

Salt's methods return us to the issue of objectivity in film analysis, and the extent to which that can ever be satisfactorily achieved. Moreover, his approach corresponds with analysis that seeks to order and organize the film text. For Salt, this process is conducted through the collation of data such as average shot lengths, and Bellour perhaps has a similar aim in mind when he constructs his diagrams and shot-by-shot breakdowns. We would need to test further whether this task of organization properly accounts for the films placed under scrutiny. However, even an initial consideration offers the possibility that certain issues emerge from these practices, not least in terms of what happens to the shape and flow of films when they are subjected to such stringent, overarching analyses. It is worth noting that such characteristics do not extend across everything in film studies that might be termed "analysis." Douglas Pye, for example, begins his short analysis of a moment from Hitchcock's *Rear Window* in markedly different fashion:

Fade in on a partial view of the courtyard at night, the apartments to the right of Jeff's window catching the orange glow of the night sky, the rest of the space almost dark. Camera movement from right to left catches glimpses of people in their rooms; a few lights are on in the apartments (one comes on as we pass). The camera movement ends on Jeff (James Stewart), asleep in his wheelchair, his body parallel to the window, his face turned in towards the apartment. The dominant sound is of a soprano practising scales, accompanied by a piano, the sound unlocated but evidently nearby, the first chord on the piano timed to the opening of the shot and followed by three scales, then a longer final scale which ends as a shadow – cast from frame left, inside the apartment – rises over Jeff's body and onto his face. Until the dialogue begins there is now only the faintest of ambient sound. Cut to a low angle close-up of Lisa (Grace Kelly), dimly lit, lips slightly parted, looking directly into the camera and growing larger in the frame as she moves towards us. Cut back to Jeff, still asleep, the shadow moving up to cover his face. His eyes open, he looks up and faintly smiles. Cut back to Lisa in even tighter close-up, again looking into the camera (now that Jeff is awake the shot seems to be POV) and moving down to fill the frame. Cut to a profile two-shot, very close to the faces, Jeff on the right looking diagonally up and Lisa to the left looking down and moving into a kiss, her movement apparently step-printed to produce a fractionally staggered effect. She kisses him. (Pye, 2010, p. 45)

An underlying aim of Pye's analysis is to capture and convey aspects of the scene's shape and movement as he describes it to us. The opening words "Fade in on a partial view of the courtyard at night" draw us into the discussion through their efficiency and lack of conventional preamble, making an immediate connection with the reader but also resembling a typical direction from a shooting script – "fade in" displaying the author's commitment to technical details that achieve effects. And, of course, the phrase evokes our experience of watching films – especially of watching Hitchcock

films – whereby we can be dropped into the action through a simple shot transition with varying degrees of force. From that opening, Pye dedicates himself to a process of evoking the sensation of the film's aesthetic composition as it is experienced by the spectator: the tracking of the camera, the rising of a shadow, faint ambient sounds, a move to tight closeup. The approach is methodical, with each feature detailed in order to express its role within the unfolding scene, but this process does not resemble the kind of purposefully neutral cataloguing we might encounter elsewhere in detailed analysis before the business of interpretation takes place.

Indeed, Pye's style of analysis anticipates interpretation and builds that anticipation into analysis as certain features are lingered upon in order to preempt, albeit delicately, the ways in which they might become significant. The description of "Lisa . . . dimly lit, lips slightly parted, looking directly into the camera and growing larger in the frame as she moves towards us" is not an arbitrary recording of visual data but rather an attempt to engage with the extraordinary effect that moment achieves within the film. In this sense, we might suggest that a kind of interpretive analysis takes place in Pye's work and that it is unfolding alongside, or perhaps in combination with, the ways in which this sequence in turn possesses an unusual point of view: the camera moving through and across details before settling upon its transient point of focus.

Pye does not divide up or seek to organize the film in the way that other analysts might be inclined to do. Rather than taking the film apart in order to inspect it, he displays a firm commitment to keeping it in shape, attending to the ways in which details unfold in the scene in a manner that best evokes that unfolding. In this way, the analysis lacks some of the near scientific exactitude we might find in the work of Salt, Bellour, and, to a lesser extent, Bordwell and Thompson. Even at this early stage, we can detect without too much difficulty that the analysis features the author's subjective voice. Ending the paragraph with a simple "She kisses him" after a section of detailed and fluent description provides a point of abrupt emphasis in the work, demonstrating that words are being chosen not only for their descriptive value but to define a writing style. If the skeptical reader were to cite the lack of scientific rigor and the subjectivity inherent in Pye's work as negatives, they might also be inclined to point out that his writing is more description than analysis – lacking, for example, the kind of systematic shot breakdowns that we find elsewhere and, as a result, remaining unsatisfactorily loose. It is worth staying with this potential division between description and analysis, especially in the light of some thoughts that Andrew Klevan has advanced on the subject while in conversation with the American philosopher, Stanley Cavell:

In the University where I teach we are encouraged to use a standardized form where we grade student essays. The form breaks down the assessment of the essay into different categories, and two of these categories are "description" and "analysis." Description is presupposed to separate from analysis, and often description is seen as a weakness, or at any rate, weaker than the thing we call "analysis." Therefore, if you've done a lot

of analysis that is good, but if you merely seem to be describing then that is bad. Yet, I *want* my students to describe. (Klevan, 2005, p. 170)

Klevan's remarks have potency as they can be seen to extend across all the analyses covered in this chapter. If we are to assume that analysis and description are distinct, then a dilemma emerges as to where the point of separation should be marked. In Pye's case, it is apparent that analysis and description have, from the first paragraph, become entwined and that no easy disentangling can occur. To return to Klevan's point, we have a passage of critical description that develops and refines an understanding of the film's aesthetic composition, and so any attempt to differentiate description from analysis would become meaningless: the former is not merely a condition in order for the latter to take place. The interweaving of description and analysis continues in Pye's essay, even when we reach passages that are most emphatically interpretive:

[Lisa's] threatening shadow links back, via the conversation with Stella, to the Thorwalds' first appearance as the embodiment of Jeff's view of married life, and forward to the elaborate doubling of the two couples. If, for Jeff, Lisa at first most obviously parallels the "nagging" Mrs Thorwald, it is startling to recognise in retrospect that, in a telling rhyme across the film, Lisa's look into camera and at Jeff is echoed when Thorwald's more obviously threatening gaze moves from Lisa's gesture with the wedding ring, up and across the courtyard, to meet Jeff's eyes as he (and we) look through the telephoto lens. (Pye, 2010, p. 48)

In this section, Pye draws upon his propensity for evocative description in order to trace a series of thematic links between moments from the film and, as a result, convey a sense of *Rear Window*'s overarching coherence. By fusing description with analysis, he discards any divisions between the two and, furthermore, combines them in conveying a central interpretation. It is also striking that, in order to reach conclusions of this kind, Pye moves away from considering only the moment of Lisa's entrance. Straightforwardly, he does not allow himself to get tied to the moment and as a result is able to move between scenes in order to propose a series of wider resonances. But, furthermore, the fluency inherent in Pye's style of analysis translates into freedom that allows him to move through the film's data with ease. Like the camera that sways around the courtyard in *Rear Window*, allowing and restricting access simultaneously, Pye manages to stay above the film's detail while at the same time focusing in on certain moments that he takes to be crucial. There is no doubt that, while it has a clear methodology, this approach is less formally structured than other examples of film analysis we might encounter. Moreover, it is reliant upon a subjective and, at times, critically discriminating interpretation of the film. Of course, as with the previous examples discussed in this chapter, how far we take these reservations depends upon how we view the role and function of film analysis. It is inevitable that for some Pye's work (and work of that kind) will represent a fluent and

expressive version of film analysis while, for others, may lack the rigid definitions or attempted objectivity.

Conclusion

A short survey of different approaches to film analysis can only go so far, and it is worth acknowledging that work of this kind always holds the potential to be extended and taken in new directions. Other analytical models could then be incorporated and the influence of other pertinent theories (psychoanalysis, for example) in film studies could be addressed and evaluated. Nevertheless, the small sample represented in this chapter conveys something of the diversity that can be found within the overarching title of “film analysis,” highlighting similarities and disparities between different methodologies. It is hoped that, despite certain reservations being expressed and explored, all of the approaches are kept in play and their respective merits are not overlooked. In stating at the beginning of this chapter that no agreed model of film analysis has emerged in film studies, I am also suggesting that film studies has not resolved the divergences that exist between different approaches. The pursuit of one defining methodology seems futile given that such an activity would inevitably involve neglecting some of the benefits offered by different forms of film analysis. Retaining the current state of plurality provides those doing the work of film analysis with options – a series of different directions that might be pursued. And, of course, this state gives rise to the potential for a combination of approaches to be employed in film analysis, drawing together the relative strengths of each methodology.

Eye Tracking in Media Studies

Theory, Method, and Its Exemplary Application in Analyzing Shock-Inducing Advertisements

Stephanie Geise

ABSTRACT

This chapter provides an overview of the fundamentals, theories, and application of eye tracking as a method of communication and media studies. The examined “object for analysis” – the process of visual perception – is understood here as a multidimensional phenomenon, to which justice can be done only through a multifaceted theoretical foundation. An approach to the method of eye tracking must therefore start with theoretical considerations on the physiological and psychological aspects of (visual) perception and cognition. The chapter then elaborates on the implications of these theoretical considerations with regards to operationalization, analysis, and interpretation of the eye-tracking data. Finally, it discusses and critically assesses specific examples of studies employing eye tracking to illustrate how the method may be applied to media studies research.

Although the method of eye tracking does not yet constitute a standard instrument of media studies, in recent years it has been repeatedly used for analyzing the reception of media and its effects, and its implementation in research designs is increasing. The improvements in eye-tracking technology, especially the availability of easier to handle, faster, and more accurate eye trackers, as well as the decline of acquisition

costs, have inspired eye-tracking studies in the field of media studies. Eye movements have now been established as indicators for drawing inferences regarding psychophysiological processes, such as activation or visual attention, as well as connected cognitive processes – for example, interest in certain contents, motivations, and like or dislike (Duchowski, 2007; Hammoud, 2008). The inherent fascination of eye tracking is “eye catching”: as a technology-based, empirical observation method, eye tracking allows deeper insights into the otherwise hidden *reception process of visual perception*. Eye tracking can, however, do more than display when and how recipients perceive which visual stimuli visually. According to previous findings, the analysis of eye movements also allows inferences on active perceptive and cognitive processes when visually perceiving photos, posters, advertisements, newspaper pages, Internet sites, or movies.

A particular scientific potential can be seen in the combination of eye tracking with other empirical methods of communication and media science. If one focuses, for example, on the *effects* of media reception and if the presentation of visual stimuli is accompanied by a questionnaire aimed at capturing changes in cognitive structures, eye tracking helps to identify what information items have actually been perceived by the recipients, that is, what could have caused the potential effects.

Against this background, this chapter explores the founding theories and applications of eye tracking as a method for media studies. The object of analysis – the process of visual perception – is hereby understood as a multilayered phenomenon, to which justice can be done only by a theoretical foundation that addresses all of these layers. Researching with the apparatus-based method, eye tracking therefore necessitates: (1) familiarity with the technical and methodological requirements, (2) psychophysiological knowledge on the human eye and its movements, as well as a deeper understanding of (3) cognitive processes of visual perception and information processing. These interdisciplinary facets constitute the theoretical basis on which the implications for operationalization, analysis, and interpretation of the eye movement data are established.

An in-depth discussion of all the relevant theoretical, methodological, and empirical results is, however, beyond the scope of this chapter. After providing a synopsis of the theoretical and methodological foundations of the method, this chapter will instead focus on the application of this method in media studies, which will be illustrated via a case study.

Eye Tracking: The Method

When Duchowski (2007, p. 3) notes that

We move our eyes to bring a particular portion of the visible field of the view into high resolution . . . We also divert our attention to that point so that we can focus our atten-

tion on the object or region of interest. Thus, . . . if we can track someone's eye movements, we can follow along the path of attention deployed by the observer

he points to the origins of the research field of human eye movement analysis. Eye tracking allows for the apparatus-based recording of eye movements. This is what characterizes eye tracking as a unique approach, since it is the only empirical method to date to provide an exact reconstruction and analysis of this process. With this research focus, eye tracking differentiates itself from other physiological measurements of the visual perception apparatus that examine not the extra-ocular muscle movement of the eye, that is, the eye movements, but single parameters such as the change of pupil size ("pupillometry"; Backs & Walrath 1995), movements of the eyelids ("eyeblinks"; Stern, Walrath, & Goldstein 1984) or changes in the accommodation condition (Piccoli, Perris, Gratton, & Grieco, 1985). Furthermore, in the recording and analysis of eye movements via eye tracking the visual stimulus or *fixation target* is, by definition, recorded and integrated into the analysis (Duchowski, 2007).

Eye-tracking research can therefore be specified as apparatus-based, *fixation-dependent analysis of individual eye movements*, which enables the researcher to qualitatively and quantitatively describe, analyze, and interpret them. Through this, eye tracking provides rather precise indications as to what content recipients foveally fixate on during the reception of the visual stimulus (i.e., focus with their *fovea centralis*, the eye's center of concise visual perception), with what intensity they visually turn toward the presented content or information, in what temporal and contextual order the observations are made, and where no visual attention is allocated (Gale, 2003). In contrast, eye tracking provides no or only little potential for clarification on what *content* recipients perceive during the reception of the visual stimulus in the peripheral or para-foveal perception space. Additionally, it cannot reveal why, or with what intention or motivation, recipients turn toward visual stimulus areas, what they think and feel when they turn toward them, or what subsequent emotional and cognitive processes are connected to the reception of the respective visual stimulus areas.

Despite these limitations, and because of its potential to cast light on the process of visual perception, eye-tracking methodology can be applied in a vast number of research fields, from physiologically based studies that explore the fundamental mechanisms of visual perception to advertising research and usability studies. For example, eye tracking has been used to study the interaction of eye and eyelid movements (Gandhi & Katnani, 2011) and the saccadic decision-making process (Ludwig, 2011), and has been implemented in research that aims to explain eye movement control during reading (Rayner, 1998; Vitu, 2011) and language processing in dialogues (Kreysa & Pickering, 2011). Another research field, connected to information technology and computer science, operationalizes eye tracking to study the possibilities of optimizing human-computer interaction, such as in hardware or software usability studies (Ehmke & Wilson, 2007). For media studies the method possesses

enormous potential with regards to the *reconstruction and analysis of visual perception and processing* and can be utilized in many ways in the examination of questions *directly* originating from the reception process (Geise, 2011; Geise & Schumacher, 2011); for example:

- 1 The distribution of attention with regards to duration and frequency of defined elements (“areas of Interest”) of a visual stimulus, for example, a web page, a newspaper page, an election poster (Adam, Quinn, & Edmonds, 2007; Goldberg, Stimson, Lewenstein, Scott, & Wichansky, 2002), a movie or a video sequence (d’Ydewalle, Desmet, & Van Rensbergen, 1998; Hughes, Wilkens, Wildemuth, & Marchionini, 2003).
- 2 The allocation of visual attention: its common structure as well as its specific patterns on a media stimulus in relation to its graphical design and visual presentation (Geise, 2011; Holmqvist, Holsanova, Barthelson, & Lundqvist, 2003; Holmqvist & Wartenberg, 2005; Josephson, 2005; Stenfors, Morén, & Balkenius, 2003).
- 3 The structure of human–computer interaction and its specific patterns during the use of websites, in relation to their visual design (Grier, 2004; Jacob & Karn, 2003), especially in usability research (Goldberg & Wichansky, 2003; Manhartsberger & Zellhofer, 2005).
- 4 The temporal and spatial characteristics of functionally different phases of reception such as orientation, scanning, or reading (Bucher & Schumacher, 2006; Holmqvist et al., 2003).
- 5 Processes of visual perception and cognitive information processing in the reception of complex visual or hypertextual offerings (Holsanova, 2011).
- 6 Processes of visual perception and cognitive information processing, also with regards to the analysis of disorders in information processing and understanding, for example when using multimodal e-learning programs (Dogusoy & Cagiltay, 2009; Shukla, Wen, White, & Aslin, 2011; van Gog & Scheiter, 2010; Zambarbieri, 2003).
- 7 Perception, attention, and interaction patterns in virtual worlds such as Second Life (Triesch, Ballard, Hayhoe, & Sullivan, 2003; Walter, 2009) or while playing with a computer (Joensson, 2005; Kickmeier-Rust, Hillemann, & Albert, 2011).

Nevertheless, the productive potential of the method is far from exhausted. In the field of media studies, in particular, the implementation of eye-tracking methodology still is an exception; and thus, a limited number of eye-tracking studies exist addressing the “classical questions” of mass media, their perception and effects. However, most studies implementing eye tracking share the same theoretical assumption: visual perception is understood as a fundamental *precondition of any cognitive or emotional effect* that a visually perceived stimulus can induce. Following this idea, the recipient’s actual eye movements can be segmented into a *set of relevant indicators* that reflect the medium’s inherent effect potential. Taking the influence of individual

predispositions as well as situational factors and stimulus-specific features on eye movements into account (Radach, Lemmer, Vorstius, Heller, & Radach, 2003), the *visual characteristics of the stimulus* have to be seen as highly important in the perception process, as they hold the potential to modify or even control the recipient's eye movements. Implementing these ideas in a scientific setting, one can propose that differences in the nature of the visual stimulus – for example, visual versus textual communication mode, unimodal versus multimodal, or dynamic versus static content – should have *observable* effects on the recipient's eye movements that are, via eye tracking, recordable and reconstructable. Nevertheless, it has to be considered that eye movements only *reflect* intentional selection and perception processes (Theeuwes, 1993). While the sensorial visual perception is functionally operated by the eyes, the seeing itself has to be understood as a *cognitive construction* that is guided by our brain: “The eye is not innocent, because depiction cannot be explained by perception alone; sight is informed by . . . the cognitive” (Lopes, 1996, p. 32).

Thus, researching with eye-tracking methodology involves more than utilizing an eye tracker as a specific technical device; setting up the research design necessitates a deeper knowledge of the technical operating mechanisms of eye-tracking processes and their methodological requirements as well as knowledge about visual perception and information processing. This is no less true for the processing and analysis of the collected data. The next section briefly summarizes the most important fundamentals of apparatus-based recording of visual perception through eye tracking.

Structural Components of Human Eye Movements: Fixations, Saccades, Micro-Movements

“We have the subjective impression of an immediate, full detail, pictorial view of the world. We are prone to forget that this impression is, in a very real sense, an illusion” (Findlay & Gilchrist, 2003, p. 2). This statement not only alludes to the subjectivity and selectivity of perception, but also to the fact that the human vision system by no means delivers a permanent and complete perception, even if we have this impression. Although the retina is nearly completely covered by photoreceptors, an individual can see well only with a small part of it: the *fovea centralis*, an area of most focused sight only about 0.5 mm wide, covers only around 1% of the field of vision. In order to achieve precise visual perception the eye is controlled by extra-ocular muscle movements so that the object of interest is in the sight of the fovea and can be perceived with maximum resolution.

Eye-tracking research has identified several factors that influence human visual perception and eye movements (Henderson, 2003). For example, our visual attention – and, therefore, our eye movements – is attracted to suddenly appearing objects, visually salient pieces of information, and distinctive and “new” visual stimuli – even if these materialize only in the peripheral field of view. Thus, eye movements are

Figure 19.1 Visualized scan paths of five randomly chosen subjects of a Dior advertisement poster (2010): eye-tracking measurement of 4 seconds; scan path of each person in one color (analysis with Tobii Studio)

assigned the central task of preparing foveal perception and of providing the necessary orientation information from the peripheral field of sight (Findlay & Gilchrist, 2003).

Every eye movement can be structured as a *scan path* that is constituted through at least three basic structural components (see Figure 19.1): (1) the *fixations* as centered focusing of the fovea on a visual object; (2) the *saccades*, which serve through the orientation of the eye as a preparation for foveal fixation (and usually result in a fixation); and (3) *micro-movements* (especially *micro-saccades*), which are mostly undirected and serve physiological fixation control in a situation of spatial movement. In addition, *vestibular eye movements*¹ are also to be expected. Particularly important for eye-tracking measurements is the differentiation of fixations, where the gaze rests for about 300 milliseconds – and which are recorded by the eye tracker – and saccades, where the eye “jumps” extremely quickly to the next fixation destination (Hoffman & Subramaniam, 1995). Saccades are not directly recorded by the eye tracker, but are technologically reconstructed later, as during these jumps top speeds of up to 1000 degrees per second are measurable. In fact, saccades are the fastest movement the human body is capable of (Fuchs & Kaneko, 1981; Gil-

christ, 2011). On average, about three to five saccades happen every second. Thus every day the eye is moved in tens of thousands of saccades occur for the most part unconsciously although they are generally directable. Even during a fixation, however, the eye is not completely at rest: more or less undirected micro-movements can be detected, which happen several times a second (Duchowski, 2007; Gilchrist, 2011). The illusion of a continuous optical perception of our environment is supported by two factors: (1) the extraordinary integration and construction ability of our brain; and (2) the high adaptability of the human vision system. There are, however, strong interdependencies between eye movements, as a “fundamental feature of vision” (Findlay & Gilchrist, 2003, p. 1), and the entirety of visual information processing. For most of the common eye trackers micro-movements are not detectable – they are recorded as part of the corresponding fixation. However, as a micro-movement’s function is primarily to reposition the fovea, for most questions of communication and media science they are of subordinated interest anyhow and can be neglected.

In sum, the scan path cannot be assumed to be linear and sequentially stringent, it is best conceived as a loose, more or less intended zigzag pattern. This structure becomes evident once the scan path has been recorded by eye tracking and graphically reproduced. A visualized result of an eye-tracking analysis of several subjects, translated into fixation points and saccadic lines, is shown in Figure 19.1. As mentioned, the *micro-movements* that are summarized in the fixation points are not depicted.

The information intake of the recipient occurs during the fixations, which occupy around 90% of the whole viewing time of visual perception. Paradoxically, although fixations (or, to be more precise, the indicators derived from them) play a central role in the analysis of *eye movement*, fixations in themselves do not constitute a movement of the eye as such. A fixation is defined as the condition where the eye is at a *relative standstill* compared to a perceived object. The minimum fixation length is often assumed to be around 100 milliseconds; average fixation lengths are a multiple of that. During the approximately 30–90 milliseconds that a saccade lasts no intake of information is possible. Here, the phenomenon of *saccadic blindness* occurs: around 30 to 40 milliseconds prior to and up to 120 milliseconds after the start of a saccade² – for very short saccades, this is during the first fixation phase – visual perception capabilities are extremely limited (Gilchrist, 2011; Hoffman, 1998). Saccades only allow the recipient a rough orientation in the perception process (and even that is a matter of discussion). For Findlay and Gilchrist (2003, p. 7) saccades can nevertheless be considered an *active system*: as not only are they a visually controlled motor response but their operation also controls the input of visual sampling, their involvement with vision takes the form of a continuously *cycling loop*. Before eye movements are started, the information that is visually perceived on the peripheral or foveal field of the retina has to pass numerous stages of visual information processing, which start on the retina itself but also involve higher cognitive processes, especially in the visual cortex (Bullier, 2001). Accordingly, visual perception and visual information

processing are obviously more than just the inner reflection of the world that is visually represented outside: *vision and cognition interact in a highly intimate way*.

For this reason – and from which the explanatory power of eye-tracking research derives – the recorded eye movements allow inferences on active perceptive and cognitive processes during visual media stimulus perception. The most apparent inference is the connection between eye movements and *visual attention*, as the scan path offers information about *where visual attention is absorbed and for how long* (Deubel & Schneider, 1996; Just & Carpenter, 1976). Posner (1995) argues that the visual attention of a recipient is “bound” during the observation of a fixation target (*attentional engagement*). Prior to a saccade, and thus a new positioning of the fovea, the visual attention has first to be shifted from the original fixation target and redirected (*attentional disengagement*) (Posner, 1995). Only this redirection of visual attention can lead via saccadic control to the next fixation target: without attentional disengagement, there would be no saccade (Findlay & Gilchrist, 2003).

Exogenous and Endogenous Control of Visual Perception

While the fovea is centrally directed onto an object during fixation and temporally stabilized in this position, directly afterwards – due to saccadic movements – a new positioning follows: When visual attention is directed to a new area, saccades reposition the fovea. Here, the interaction of attention, visual perception, and processing can (in simplified terms) be interpreted as an *attentional feedback loop*. Fixations thus do not occur arbitrarily but can rather be seen as intended manifestations of the conscious or unconscious interest or motivation to look at certain objects more elaborately (McLeskey, Levie, & Fleming, 1982). In this process (visual) attention presents itself as a central predictor for the rhythm of saccades and fixations (Proulx, 2007; Wright, 1998), with individual stimulus-specific and situational factors modulating the scan path (Godijn & Theeuwes, 2003). An object suddenly appearing in the field of vision will, for example, automatically receive attention and thus focusing, even if the perception remains irrelevant for a subsequent course of action. This affective intuitive mode of external gaze direction is also known as *exogenous control* or *stimulus-driven perception* (Proulx, 2007). Exogenous reactions to perceptions due to stimulus reaction schemas are considered relatively uncontrolled (Schneider & Maasen, 1998; Yantis, 2002); they prove to be highly invariant across individuals. As this bottom-up process seems to reflect automatic, evolutionary, and biologically programmed mechanisms that are deeply rooted in human perception behavior, the bottom-up perception often is interpreted as one basic “component of natural human vision” (Duchowski, 2007, p. 162).

Bottom-up perception can be placed in contrast to *endogenous control*, or *goal-driven perception* – a consciously intended perception process (Godijn & Theeuwes, 2003).

The latter is based on specific action or perception goals, or the expectation of them. Already the early scan path analyses of Yarbus (1967) had shown prototypically, that scan paths can diverge significantly depending on individual expectations or requirements. A complete theoretical foundation of the interaction between visual attention and eye movement therefore exceeds solely affection-motivated viewing behavior and incorporates higher cognitive functions into the analysis (Gordon, 2004) – as, for example, the intention of a visual search task. Visual perception is thus not only a simple bottom-up process, as was believed in the early stages of visual perception research. Instead, understanding vision as a complex interaction of endogenous and exogenous perception processes that are guided by cognitive mechanisms of intentional *strategic control* (Proulx, 2007) seems to be more appropriate.

What Fixations and Saccades Tell Us

Eye tracking has a great potential to objectively uncover the structure and hierarchical sequence of visual perception as well as the allocation of visual attention. Based on this, it also allows conclusions on higher cognitive tasks. However, it cannot directly reveal the processes happening *within* the recipient. For these mental processes, the scientist remains a passive observer and can only partially uncover what the recipient is doing, why he or she is doing it, and what he or she is thinking and feeling while doing it. Thus, although fixations and saccades can tell a lot about visual perception and information processing (see below), their deeper interpretation requires further contextualization. Eye movements are unspecific in their meaning unless the eye-tracking data are connected to the specific research context.

However, in line with previous findings, eye movement data allow some general conclusions on the allocation, depth, and order of visual and cognitive processing steps, as strong interdependencies exist between eye movement and visual information processing. One of the central premises of the interpretation of eye-tracking data is that visually perceived stimuli are instantaneously processed. According to this *immediacy assumption*, fixation times are often used as a measure for the depth of cognitive processing. The processing length is consequently identical to the fixation length: “The immediacy assumption posits that an attempt to relate each content word to its referent occurs as soon as possible” (Just & Carpenter, 1980, p. 341; see also Carpenter, 1988, 1991; Carpenter & Robson, 1999). Moreover, as demonstrated by studies by Just and Carpenter (see, for example, Just & Carpenter, 1980) on reading behavior, *fixated objects are instantaneously processed* and the cognitive process lasts exactly as long as the recorded fixation (*eye–mind assumption*) (Just & Carpenter, 1976, 1980). The fixation length is thus equivalent to the duration of central processing. Finally, conclusions on the hierarchy of mental processing can be drawn from the analysis of the scan paths, as *the sequence of fixations allows a reconstruction of the order of central processing steps* (*eye–mind sequence assumption*).

Various overviews of different physiological parameters describe eye movements as a highly sensitive indicator for processes of mental demand (Carpenter, 1988; Carpenter & Robson, 1999). Also, the general existence of a momentarily occurring “looking without seeing” – as can be observed in “dreamy behavior” or “lost in thought staring” – does not in a narrow sense constitute a limitation of these eye–mind premises. Finally, the immediacy assumption and the eye–mind assumption do not have to prove true for every single fixation but for the sum of all fixations. And last but not least, most of the eye-tracking research settings make a “dreamy behavior” during the reception process relatively unlikely.

However, all of the presented principles have to be adapted to the particular research context and have to be critically evaluated against the background of the specific research questions and the implemented methodological setting. In the course of the data interpretation, for example, one usually assumes that the fixation and observation length can be interpreted as an indicator of cognitive processes or respectively processing performance. However, it remains to be asked which specific cognitive processing tasks occur during the fixation of individual visual information items and which cognitive interdependencies exist: “Although a given cognitive event might reliably lead to a particular fixation, the fixation itself does not uniquely specify the cognitive event” (Hayhoe, 2004, p. 268).

Additionally, although the majority of stated premises are in line with the fundamentals of visual communication and its perception (Geise, 2011), researchers should critically reflect that most insights are based on studies concerning the analysis of visual perception while *reading*. While only a few strategies for *scene viewing* have been discerned, in contrast to reading behavior, there seem to be no established eye movement canon for particular visual objects and images (Duchowski, 2007). As the perception and information processing of *visual images* may function differently in reading and in real-life scene perception some theoretical implications and/or their limitations may require further adaptations. For example, while a linear, left-to-right scan path would be expected during reading in the Western world, it could not be predicted during image perception, where the holistic reception process of images would rather result in a zigzag structure (see Figure 19.1). From this, three methodological consequences can be derived: (1) there is a need for research that addresses theoretical and methodological premises and their specific explanatory power in terms of the reception of *image* content; (2) the study of (visual) media content may need further theoretical and/or methodological adjustments; and (3) in this modification process all implemented adaptations have to take the specific research context into account.

Additionally, it is important to note that scan path implications, and thus the research parameters derived for their study (see Table 19.1), have not yet been fully explored and consolidated. Thus, the interpretation of eye tracking-data should be considered critically against the background of the specific research questions and/or research design at hand, especially since few studies address methodological challenges (as the above mentioned) when utilizing eye tracking. Depending on context,

Table 19.1 Overview of the indicators of eye-tracking analysis

Indicator	Implication of the indicators
FIXATIONS AND FIXATION-BASED INDICATORS	
Time to first fixation	Provides evidence on the activation potential of an area of interest; short time to first fixation signifies high activation potential
Observation length of fixation	Shows how intensively or how long the eye keeps a specific area of interest fixated, and thereby the allocation of attention. Longer observation length makes a higher degree of information input probable.
Fixation count	Measure on how many fixations are attributed to a certain area of interest. A high fixation count signifies a high degree of interest or activation potential; it can, however, also be a sign for a (too) high complexity of this area.
SCAN PATH AND SCAN-PATH-BASED INDICATORS	
Scan path position	Identification of typical entry points into the observation process; provides information on activation potential or degree of activation of a stimulus area and – derived from that – optimization potential for scan path control
Saccadic amplitude/length	Indicator for the sensitivity of peripheral perception and the attention window of para-foveal perception
Distribution of fixations	Measure for different modes of information processing, task-connected skills of a recipient, the conciseness of a target object as part of the visual stimulus or the difficulty of a searching task
Backtracks	Often used in reading research; most times interpreted as a processing difficulty
Transition matrix	Provides evidence on typical scan paths or irritations in the stimulus
Scan path duration	Measure to describe the duration of a global visual search or solution to a task
Scan path length	Comparable to scan path duration; measure to describe the duration of a global visual search or solution to a task
SACCADES AND SACCADE-BASED INDICATORS	
Fixation saccadic ratio	Indicator for the requirements on information processing
Saccadic count	Refers to the quality of visual search and visual processing
Saccadic duration	Allows conclusions concerning visual attention and mental presence/fatigue of the recipient
Saccadic velocity	Provides evidence of vigilance and cognitive strain
Saccadic latency	Indicator for the “visual reaction time”; is reflected in the influence of arousal mechanisms on scan path control
Saccadic length	Indicates extended orientation reactions or stimulus areas with higher visual conciseness

even seemingly “unambiguous” indicators, such as, for example, the interpretation of observation lengths, can at the very least be rather confusing. This is another reason why a commonly shared standard of research indicators and their interpretation is developing only slowly (Granka, Feusner, & Lorigo, 2008).

Nevertheless, a few key variables can be identified that can serve as significant indicators of human eye movement analysis. Table 19.1 provides an overview of

these indicators, which are of special interest to questions of communication and media science (for a more detailed overview, see, for example, Ehmke & Wilson, 2007; Goldberg & Kotval, 1999; Jacob & Karn, 2003). It is noteworthy that the majority of the existing “aspects of eye movements” are conceptualized via the level of *allocation of visual attention* (Radach et al., 2003). It is thus implicitly assumed that the allocation of attention can be interpreted as a function of the motivation of the recipient, his or her interests, goals and capabilities, which can, in turn, be significantly modified by factors such as the perception situation or stimulus-specific characteristics. As visual attention can be controlled endogenously as well as exogenously, the possibility exists – particularly in early phases of visual perception (Bucher & Schumacher, 2006; Geise, 2011) – that visual attention is also activated independently of the individual perception intention through properties of the stimulus (thus also, *stimulus-driven*) (Godijn & Theeuwes, 2003). On the basis of this assumption individual stimulus-specific and situational factors modulate the allocation of visual attention – the structure of (exogenous) visual perception should (at least partially) be interpretable as a function of the stimulus.

In this interpretation, however, it has to be taken into account that the common distinction of perception being unambiguously *either* exogenous *or* endogenous has to be questioned (Bucher & Schumacher, 2006). Although this distinction offers some explanatory power, it neglects possible interrelations between exogenous and endogenous perception control: Where does endogenous control of visual perception start? Where does exogenous control end? Where do the two interact? Given the interdependency of endogenous and exogenous perception, what does that mean for visual perception and its processes? How might that impact its empirical analysis? How can one differentiate between them analytically or, to be more concise, which elements constitute themselves in a scan path on the basis of stimulus-driven perception and which on the basis of individual preferences? Potentially, the empirical “inability” to capture factors of endogenous control (for example, inherent influences of an individual’s characteristics) has to be attributed to the fact that existing measurement methods may not be capable to sufficiently record the *interdependencies* between endogenous and exogenous control during visual perception and information processing.

With the theoretical and methodological foundation set we will now explore the method through its implementation in a case study – a study on shock communication. We will also critically reflect on the opportunities, challenges, and limitations the method presents.

Setting Up an Eye-Tracking Study: A Case Study on Shock-Inducing Advertisements

Eye-tracking technologies which allow the concise recording of an recipient’s eye movements are commonplace today – including table-mounted eye-tracking systems

Figure 19.2 Stationary table-mounted eye tracker Tobii T120 in a data-recording situation during a study on the reception of shock advertisement (University of Hohenheim study)

that operate through video-based measurements of the corneal reflex of the retina. (Duchowski, 2007; Hammoud, 2008). These technologies strive to influence subjects' behavior as little as possible and to work without hindering and obtrusive devices. For most of these technologies, the optical impression is equivalent to a modern PC monitor (as, for example, in the Tobii system; see Figure 19.2). A monitor-integrated eye tracker like this, which offers a "natural experience for the subjects" (Hammoud, 2008, p. 3), was used for the case study at hand. It remained close to undetectable for the subjects by operating completely without physical contact, creating a relatively naturalistic, though still experimental, setting. While more invasive systems – where subjects carry the eye-tracking technology on their bodies – usually exhibit slightly higher measuring accuracy, accuracy is not the only decisive factor when deciding on a particular eye-tracking system. The type of stimulus material is also critical: the noninvasive processes whereby a camera is integrated into a screen are especially appropriate with media that can be depicted and observed on a screen. If, on the other hand, printed or bounded magazines or newspapers are to be examined, relatively more invasive head-mounted systems may be required. In our case, the treatment consisted of full-page, shock-inducing advertisements, a kind of stimulus for which passive table-mounted systems are particularly well suited.

Regardless of the technology used, the eye-tracking process starts with the individual localization of the eyes of the subject: for this purpose the subject sits on a stationary chair in a slightly dimmed eye-tracking laboratory and looks at the eye-tracking screen, which is placed on a table in front of him or her at a distance of 40–50 cm. Although most passive eye trackers allow for small movements of the body or head, the subject should move close enough to the edge of the table so that he or she lightly touches it, and the body is stabilized by putting the arms on the table-top. In order to adjust the individual vision characteristics of the subject to the eye-tracking system as well as to the stimulus material – which has been fed into the eye-tracking software – an initial calibration procedure is conducted. Subjects are asked to focus on five to seven points and to follow them as they move across the screen (for additional details on the adjustment and fine tuning of the calibration with different eye-tracking systems, see Duchowski, 2007; Hammoud, 2008).

Subjects' eyeglasses or contact lenses do not usually negatively influence the calibration process and, after a short acclimatization phase, the actual eye-tracking process can be started. First, the already uploaded stimulus is presented to the subject for a preset time on the eye-tracking monitor – in our case advertisements with shock-inducing motives. After a brief introduction to the process and individual calibration of the eye tracker, the subjects were exposed to a treatment series of 11 advertisement motives including some aiming for a “shock effect,” in the sense of a visualized, intended violation of the norm (see Figure 19.3).

Here, the *test scenario*, that is, the context in which the subject is confronted with the stimulus, plays an important role. The early studies of Yarbus (1967) have shown that the *task* given to a recipient looking at a visual stimulus exerts an influence on the reception situation and thus on his or her viewing behavior. The explicit or implicit task provided to the recipient may cause significant differences in the explanatory power, the processing, and the interpretation of the results. If subjects, for example, are given advice to seek out certain information, this will induce an intentional visual search, while the task to “just get an overview” may trigger holistic perception patterns. In our study, subjects were asked to “just look” at the images; the instruction was: “In the following you will see a series of advertisements. Please just have a look at them.” The methodological setting also has to incorporate the decision about the *reception time* given to the subject. Here as well, the decision is mainly dependent on the research question. In cases where the average natural reception time of the stimulus is known – as was the case for our advertisements – and if the simulation aims for realistic, “cursory” reception, it may be a good idea to restrict the exposition time to this time span. In most cases, the exposition time can be set down to the millisecond in the eye-tracking system and can be easily varied across stimuli or subjects.

During the reception, infrared diodes record the eye movements by the millisecond by measuring the *corneal reflex*, the reflection of the infrared diode in the eye, or more specifically in the eye's cornea. In order to produce the corneal reflex, during the experiment the subject's eye is exposed to weak infrared light emitted by the

Figure 19.3 Original stimulus: Eastpak advertisement poster from the Built to Resist campaign (2009)

diodes (*near-infrared light* (NIR)). Also, integrated highly sensible LED camera(s) record the subject's eyes at the same time. The analysis software of the eye tracker (in our example Tobii Studio) then processes the recorded information to allow a reconstruction of the scan path. Our Tobii T120 eye tracker works on a frequency of 120 Hertz, which means that every second 120 values are captured. Thus, fixation lengths from a duration of 8 milliseconds and above are registered, allowing for quite accurate measurements through the fixation coordinates and their respective time stamps (start and end times). Shorter fixations remain "invisible" to the eye tracker.

In a second step, during the output phase – that is, the visualization of the data through the analysis software – these raw data were filtered according to the structure of the individual scan path and *interpreted* as fixations and saccades (Figure 19.3; on modeling approaches see Duchowski, 2007). Saccades, which are actually invisible to the eye tracker, are not recorded, but rather *constructed* in hindsight between the fixation points, when the gap in the scan path is completed through the saccade pattern. Figure 19.4(a) shows an example of such a reconstruction of the scan path: a visualized result of the recorded eye movements of the subject in our case study,

Figure 19.4 (a) Gaze plot: scan paths of 12 randomly selected subjects projected onto the stimulus with an exposure time of 4 seconds; (b) heat map: visualization of the allocations of the attention of 12 subjects in an “attention landscape” projected onto the stimulus with an exposure time of 4 seconds

translated into fixations (visualized as the “bubbles”) and saccades (visualized as the “lines”) at a standstill.

Another typical analysis of the reconstructed eye movements aggregates, for example, the number of fixations (or, alternatively, their combined lengths) as a fixation indicator by intensity and time into hot spots of a *heat map* and superimposes this map in the visual display on the original stimulus (Figure 19.4(b)). Heat maps show the gradual, aggregated fixation density as a cluster of fixations and attention landscapes for a given (selected) reception time. A high fixation density leads, as Figure 19.4(b) shows, to a hotspot overlapping the zombie’s face, which denotes an intensively gazed upon area. This depiction of eye movement is quite close to the actual perception space: in reality as well, the foveal visual attention is not directed at discrete geometrical points but rather at larger or smaller areas of the visual stimulus. In our example, the objective recording of the recipient’s eye movements enables us to answer research questions that are connected to the visual perception process, for example: What are the area’s recipients focused on first? In what order were these areas perceived? How long was visual attention focused on which areas? Do shared or individual patterns of perception occur? Where are the areas that were not per-

ceived at all? Conducting a first eyeball analysis, one can already deduce at first sight from the heat map and gaze plot that, for example, the shock-inducing area (the zombie's bloody face and neck) has not only been fixated first, but also most intensely, and that atypically even the Eastpak logo at the bottom of the advertisement received some fixations.

Of course, for further analysis (for example, regarding differences in viewing patterns in relation to age, sex, involvement or shock resistance) the recorded data have to be compressed and aggregated. With regards to the eye-tracking indicators discussed above, we first have to decide, on the basis of the specific research question, which indicators are to be operationalized in what way. In our case study, which analyzes visual perception, processing, and evaluation of the shock-inducing advertisement, it can, for example, be assumed that – regardless of a recipient's sociostructural characteristics – a shock-inducing stimulus area carries a very high visual salience and is comparatively intensively perceived foveally. Research findings that emotionalizing stimulus elements affect visual attention and therefore eye movements point in a similar direction. Independent of other factors, recipients have been shown to look at emotionalizing elements first and for longer than at “neutral” elements (Alpers, 2008; Kissler & Keil, 2008). Here, indicators such as *time to first fixation*, *observation length*, and the type and number of *backtracks* (i.e., a sudden saccadic change in direction of more than $\pm 90^\circ$ in relation to the preceding saccade) can be utilized for empirical testing of such research assumptions: while time to first fixation provides insights into the potential of an area to activate a recipient's *visual attention* – the shorter the time to the first foveal contact, the higher the visual attention potential – a measure of how intensively or how long a recipient foveally fixated a particular area is provided by the *observation length of fixations*. It thus allows insight into a person's visual attention allocation as well as his or her connected information-processing activities. For example, a backtrack can be seen as an indicator for specific irritations in the scan path. In our case study, such a repetitive visual “drift” toward a shock-inducing stimulus element and a resulting accumulation of backtracks was interpreted as an expectation-incongruent perception pattern that induces surprise and thus results in repeated fixations.

Nonetheless, the researcher also has to take into account that most eye-tracking data are in the first place unspecific and open to ambiguous interpretation – as in many other research fields where psychophysiological measurements are utilized to draw inferences regarding mental processes. The visual characteristics of the stimulus, the recipient's goals and intentions, as well as the meaning with which the stimulus is associated, influence where recipients look and how their eye movements are structured. In order to determine and understand what recipients are looking at, their visual information processing should be connected with their mental structures, their prior experiences, and their knowledge.

Analysis and interpretation of eye movements therefore require *contextualization* to gain specific insights into the reception, processing, and effect mechanisms of the underlying visual perception. For most questions of communication and media

science, employing the eye tracking method on its own may therefore not be appropriate; this is also true for our case study dealing with the visual perception, processing, and evaluation of shock-inducing advertisements. More complex perception and effect analyses require that eye tracking be combined with other empirical methods of communication science (Geise & Schumacher, 2011). By recording additional perception and reception data and using them for eye movement data analysis, difficulties in the interpretation of the data – especially with regard to cognitive operations – can be reduced. Likewise, post-receptive questionnaires, considered an established instrument of social science, allow the collection of facts, knowledge, opinions, attitudes, or evaluations. Qualitative interviews, in particular, have the potential to complement the quantitative perception data by post-receptive oral statements of subjective patterns of meaning or sense. In our case study, we supplemented eye tracking with qualitative interviews. This method combination offers two major advantages within our research context: (1) the inclusion of the subjective perspective of the recipient as an additional source of information for the interpretation and evaluation of the current eye-tracking findings; and (2) the ability to draw conclusions on more profound interpretations, on subjective meaning, individual sentiments, associations, motives, or thoughts. As in our case, this can make sense if it is the researcher's intention to compare the eye movements to the subjective opinion of the recipient concerning his or her perception or his or her individual experience with the stimulus.

In contrast to a standardized quantitative survey, the qualitative interview is structured more openly. It is more flexible and more details can be captured that are of importance to the interviewee (Lamnek, 2010, p. 311). Most of the research questions, where a method combining the analysis of eye movement data and of the underlying subjective pattern of meaning and sense seems appropriate, are based on the idea that the interpretation of the recipient's (viewing) behavior and actions requires a deeper understanding of his or her thoughts, feelings, and intentions.

Here, the distinction of intentional versus nonintentional viewing behavior poses a huge challenge, as in this context it cannot be plausibly argued that the subjective patterns of meaning can explain the actual scan path. In a narrow sense of the word, one cannot even describe viewing *behavior* as an *action*, as not only does it happen to a large degree unconsciously (the prerequisites of intentionality could just be assumed for the phases of endogenous, consciously intended gaze control), but it is also controlled by the stimulus. It is therefore not the case that the documentation, reconstruction, interpretation, and explanation of the constitution process of social reality captured by the interviews (Lamnek, 2010) reflect the actual *viewing behavior* or the *process of visual perception*. In contrast, as in our case study, post-receptive qualitative interviews can be operationalized to deepen understanding of the recipient's individual processing, classifying, interpreting, and evaluating of the observed content against the background of his or her individual *relevance system*. Thus, if the eye-tracking data reveal that a particular visual element has proven to be salient or rel-

evant for the recipient, the qualitative interview data can specify his or her associated meanings, spontaneous thoughts, reports of pleasure or liking – and thus, the researcher can learn more about the underlying cognitive processes when perceiving the tested visual stimulus.

In our case study on the perception, interpretation, and evaluation of shock-inducing advertisements, this fact was considered of central importance. Therefore, after exposure to the advertisements, a post-receptive qualitative guideline interview followed. Specific questions on the process of visual perception or the scan path were not asked. Instead, the understanding, the interpretation, the construction of meaning, the classification, and the ethical-moral evaluation of the treatment was queried. Here, we asked whether and which taboos were evoked by the shock advertisements, whether any taboos were violated, what spontaneous associations and feelings were generated, and whether and what incentives for action were given. The results of the qualitative interview thus did not deliver additional information on what information was foveally fixated upon or why it was fixated upon. However, additional insight was provided on how the foveally fixated information was perceived by the recipient, how it was understood, associated, and interpreted. In addition, the results of the qualitative interviews were able to provide some indication on the identification of certain types of recipients (e.g., shock-affine, shock-neutral, and shock-averse recipients).

Figure 19.5 exemplifies the gaze plot of a *shock-averse* recipient who declared in the guideline interview “not being able to see blood.” As he/she put it, “honestly, that may sound childish, but it’s the case, I just cannot look at it, basta.” After the first three fixations on the shock motive (and after less than half a second) the subject directed his/her gaze onto the black screen and let it stay there for about two seconds.

Although the comparative analysis of scan paths could only be conducted exploratively in this study with regards to significant differences between reception types, the findings provide a good foundation for a follow-up study. It remains to be critically reflected that the two methods, eye tracking and qualitative survey, are approaches from *two divergent angles* – a true synchronization of the data is neither methodologically nor theoretically plausible. It is the combination of insights from two subsequent perception and information-processing levels that can complement each other in their explanatory power.

Methodological Limitations and Challenges

When it comes to the practical application of the method of eye tracking in the research process, eye tracking can in many ways enrich empirical media studies. As we tried to illustrate with the case study, it possesses an enormous explanation potential, especially in the examination of questions directly connected to the process of

Figure 19.5 Screenshot of the scan path analysis of a shock-averse recipient in the analysis software Tobii Studio shows “avoidance behavior”

visual perception and visual information processing. Eye tracking offers insights that other empirical methods cannot provide. As a first research interest, it reveals the structure and hierarchical sequence of visual perception and the allocation of visual attention. The second research interest, which is based on this, is that eye-tracking data allow conclusions on higher cognitive tasks, especially the underlying processes of visual information processing. Thus, even though it is not capable of unveiling processes happening *within* the recipients (which can be compensated for through method combination only to a limited degree), the researcher can draw some reflected inferences on internal processes, as visual perception and cognitive information processing are highly interrelated. Through eye tracking, the observation and analysis of media reception take on a new quality. Especially in combination with other methods, conscious and unconscious reception processes can be reconstructed in a way that is very close to the processes themselves.

Consequently, there are many interdisciplinary fields of media studies where eye-tracking research can provide new insights. One large research field in which it could

be of particular interest is e-learning and multimodal education; here, eye tracking could deepen the understanding of multimodal perception processes (for example, simultaneously watching and listening to a video stream) and their implications for learning (Chuang & Liu, 2011; Dogusoy & Cagiltay, 2009; Slykhuis, Wiebe, & Len, 2005; van Gog & Scheiter, 2010; Zambarbieri, 2003). Also, it could be a valuable tool for teachers, who study classroom dynamics by viewing them on video. Film or television studies could use eye-tracking methodology to analyze the perception modes of films (d'Ydewalle, Desmet, & Van Rensbergen, 1998), and especially the interrelation between video and sound information, for example, to detect points of maximum and minimum attention in relation to the soundtrack. For media studies, the eye tracking of visual perception and the processing of (pictorial) art may constitute another interesting field of research (Buswell, 1935; DeCarlo & Santella, 2002; Holsanova, 2011; Molnar, 1981; Wooding, 2002; Yarbus, 1967). Additionally, media studies could utilize (head-mounted) eye tracking to examine the audience's viewing and attention patterns in different media reception contexts, such as in classrooms, conferences, films, concerts, or sports events, as a way to detect and indicate variation in the quality of the attention in each case.

At the same time, eye tracking is still challenging. The methodological implementation of eye tracking is relatively complex and the researcher can only refer to a limited number of standardized procedures. Also, while various questions concerning the relationship between visual perception and cognition are not yet satisfactorily answered, commonly established standards for the operationalization and interpretation of eye-tracking indicators are only slowly evolving. Thus, from a methodological perspective, eye tracking offers as many limitations as challenges. Therefore, even if the researcher's focus is predominantly directed on the empirical results of eye-movement research, a deeper knowledge about the methodological requirements and technical functions of eye tracking, as well as about the underlying processes of visual perception and visual information processing is a fundamental basis for conducting eye-tracking studies, creating research designs, tracking the eye movements in an adequate setting and, last but not least, for data analysis and data interpretation.

NOTES

- 1 Vestibular eye movements (also known as pursuit movements) are eye movements that prevent a "shifting" or drifting of sensory information on the retina. They appear as a result of the movement of the body, the movement of a perceived object, or the movement of a relevant part of the visual environment, and help to continuously fix on an object (as a quick *saccade-like* following movement or as a slow sliding movement of the eyes, i.e., *smooth pursuit*) or to maintain a stable retina image (*optokinesis*). Vestibular eye movements are *adaptation movements* that (to simplify) do not structure the scan path, but rather stabilize and enable it (especially fixations) during movement.

- 2 Those values vary substantially: according to Diamond, Ross, and Morrone (2000), for example, the suppression of intake and processing of visual information already start around 75 milliseconds prior to a saccade and continue after its end for approximately 50 milliseconds.

Exploring Visual Aspects of Audience Membership

Media Studies and Photovoice

David R. Novak and Tonny Krijnen

ABSTRACT

Photovoice, a qualitative research methodology in which participants use photographs in combination with interviews, transcends the (false) binary between visual and verbal communication as images and words work in tandem to tell participants' stories (Novak, 2010). While audiences' reception of media has been explored thoroughly, visual interpretations as a key aspect of reception are under-researched. This neglect of visual aspects is striking, as audiences' reception often concerns media that are visual to a high degree (e.g., television, film, Internet). We use visual elements, specifically photographs and screenshots, to analyze audiences' interpretations of *True Blood*. Our chapter offers new ways to discuss aesthetic elements of television and the construction of latent meanings that would otherwise not appear in interviews. This chapter is a modest methodological contribution to help analyze the reception of audiences. It moves toward the inclusion of a visual aspect, via photovoice, in media studies.

While it might be obvious to state that television is a visual medium, relatively recent television shows take visuality to new levels. Take, for example, Michael Slovis, director of photography for AMC's *Breaking Bad*, who described his show as "real filmmaking, more so than even many films that you work on now" (Gajewski 2010). As media critic, Erik Kain (2011) argues:

No other show on television places so much emphasis on visuals and color as *Breaking Bad*. The show captures and accentuates the rich hues of the American southwest perfectly – and not just the reds and oranges of the landscape. *Breaking Bad* takes risks with even the most mundane moments: black hair against yellow sheets; the play of light and shadow at the dining room table; the lines in Walter White's face.

Breaking Bad is but one of a new guard of cinema-quality television shows. *Mad Men*, *The Sopranos*, *Lost*, and *The Tudors* similarly display filmlike qualities in terms of the emphasis placed on production and on photographic and design elements. Research also shows that the media industries perceive audiences as demanding good-looking television, with aesthetic elements playing a primary role (Bielby, 2011).

Culturally speaking, visuality continues to grow in importance – from the invention of the film camera to the evolution of moving pictures to the present pervasiveness of digital photographs. Evidence of visual culture's pervasiveness is everywhere. New mobile telephones and tablet computers highlight the ability to play movies and stream television episodes (Wingfield, 2012). A recent *New York Times* article noted that a shopper would be hard-pressed to even purchase a small television nowadays (Grobart, 2012). The same article claims that in 2011, "the size of the average TV sold in North America was 38 inches, and you can buy an 80-inch model for a little more than \$4,000." Just in the last few years, a renaissance of 3-D films – such as *Shrek*, *Star Wars*, and *Avatar* – has been framed as providing new visual experiences for audience members. One can even purchase a three-dimensional television to use in the home.

This emphasis on visuality is not necessarily a new phenomenon. Television reception studies demonstrate that viewers frequently express a preference for television shows based on their aesthetic qualities (Krijnen, 2007). Evidence suggests that the aesthetic quality of US television dramas and sitcoms is one of the reasons they are so popular globally; as production companies serving a smaller region have smaller production budgets, US productions' aesthetic quality is comparatively higher (Kuipers, 2011).

Despite this cultural emphasis on visuality and research demonstrating the importance of visual elements on audiences' media consumption choices, research methods in media studies have traditionally relied largely on textual or spoken methodologies to explore these visual aspects of media experiences. While interviews, focus groups, and textual analyses are perfectly good and well-established ways to study media, we base this chapter on the position that great theoretical and methodological potential lies in studying visual media with visual methods, particularly photovoice methodol-

ogy. Media studies and reception studies have embraced methodological variety, using in-depth interviews, focus groups, media ethnography, and participant journals among other methodologies, and we see photovoice as a significant additional opportunity to continue methodological development in media studies.

This chapter proceeds first with a brief review of the relevant literature, including audience reception studies and photovoice methodology. We then discuss the specifics of this research project by outlining our participants and procedures. Finally, we present the visual and textual results and discuss the possibilities of photovoice methodology in media studies.

Review of Relevant Literature: Television Reception Studies

Television reception studies have a long-standing history and take a wide variety of forms, traditions, assumptions, and debates. For our purposes in this chapter, we define television reception studies as a set of approaches in which the researcher engages with the audiences of one or more television shows to (re)construct the meanings created in the process of viewing. Such studies view audiences as explicitly active in their engagements with TV shows. Scholarship in mass media and communication has explored television reception in depth (Staiger, 2005), with studies from a media studies tradition moving increasingly toward an interpretive perspective (i.e., trying to find out how people make sense of TV and construct everyday life meanings) during the last two decades, while those from a communication sciences perspective have been moving toward behaviorist approaches (i.e., trying to find out how TV affects our behavior).

While a thorough discussion of the history and underlying epistemological perspectives of reception studies is beyond the scope of this chapter, some brief historical background is necessarily to locate photovoice in its proper context. Reception studies have focused on topics as diverse as identity questions (Gauntlett, 2008), fan cultures (Sandvoss, 2005), moral meanings (Krijnen, 2011), and girl culture (Kearney, 2011), just to mention a few relatively recent examples. Researchers use an assortment of methodologies as diverse as the research questions they are aiming to answer. Research questions in audience studies usually start with the word “how,” indicating that the researcher wishes to explore audience activities without being preoccupied with testing hypotheses or burdened by assumptions regarding what audiences do with the meaning they draw from the television that they watch. To get at that exploration, the most commonly used methodologies are the in-depth or semi-structured interview and focus groups. In both occasions, the researcher engages in conversation with one or more audience member(s) about a case, using some starting questions or a topic list. Usually these conversations are audio- or video-recorded and transcribed afterward. The transcripts are then analyzed using a certain

form of textual analysis (common choices are discourse, semiotic, or narrative analysis).

The most famous and therefore “classic” examples of this kind of analysis include Liebes and Katz’s (1990) *The Export of Meaning: Cross-Cultural Readings of “Dallas,”* which employs focus groups; Morley’s (1980) *The “Nationwide” Audience*, which employs media ethnography; and Ang’s (1985) *Watching “Dallas,”* which employs analysis of letters written by audience members. Each of these studies employs a different method but shows something similar in the results: audiences actively engage in sense making, and popular culture products have importance for them beyond mere entertainment value. In turn, studies following these “classics” sketch a tremendously nuanced picture of how people make sense of (popular) culture products in a welter of relevant fields. Almost all these studies are based on interview or focus group material discussing how audiences construct meaning from certain themes offered by TV content (Hill, 2005; Krijnen, 2011), or how they perform aspects of their identity when participating in the research (De Bruin, 2008).

To date, reception studies largely lack a visual element. This does not in any way invalidate these studies, as it may be possible to explore people’s interpretations of visual elements via observation or interviews. However, just as all methodologies have their own particular strengths, photovoice is particularly strong in helping researchers get at aspects of understanding and interpretation that cannot be gained in other ways. Specifically, photovoice allows researchers to get at visuals in a dedicated manner. Participants can provide and discuss images of moments in television shows that are meaningful, or document visual aspects that provide insight into how they experience or interpret the world in light of a television program or film. In the next section, we briefly review the background and applications of photovoice methodology, our primary method for the research project described later in the chapter.

Photovoice

Photovoice is a qualitative research method whose usage in communication, mass media, and media studies is growing. With photovoice methodology, participants use cameras to generate visual data (e.g., take pictures) about the subject matter of a research project or of an existing phenomenon. The photographs generated by participants then become central artifacts for discussion in an in-depth interview and/or focus group. Researchers can use the resulting images and interview data to discuss participants’ thoughts, emotions, behavior, and communication practices. One of the distinct strengths of photovoice is the centering of the participant perspective in the research process. While the directions given to participants can vary in their degree of specificity, photovoice, in general, encourages participants “to take photographs of lived experiences that the researcher is not (or could not be) aware of” (Wolfe & Novak, 2011, p. 7; for a more detailed explanations of how to perform a photovoice project, see also Novak, 2010, or Wang, 1999).

Photovoice developed from three main theoretical traditions: critical education, feminist theory, and documentary photography. Critical education, in the vein of Friere (1993), influences photovoice in the sense that photovoice, and its participants, seek to understand and act upon historical, institutional, social, and political conditions that impact people and communities (Wang, Morrel-Samuels, Hutchinson, Bell, & Pestronk, 2004). Feminist theory is a key underlying framework for photovoice in that the method seeks to center the individual participant experience in the research process and to de-center the position of the all-knowing researcher. Finally, documentary photography influences the development of photovoice methodology with the belief that images have the power to raise consciousness on social, political, and historical issues.

Photovoice methodology originated from the field of public health with the publication of Wang and Burris's (1994) groundbreaking essay. A high percentage of photovoice research still stems from public health (e.g., Jurkowski & Paul-Ward, 2007; Schwartz, Sable, Dannerbeck, & Campbell, 2007), but photovoice research is also prominent in the study of education contexts (Sands, Harper, Reed, & Shar, 2009), social change research (Wilson, Dasho, Martin, Wallerstein, Wang, & Minkler, 2007), disability studies (Booth & Booth, 2003), and community-based research (Gant, Shimshock, Allen-Meares, Smith, Miller, Hollingsworth, & Shanks, 2009). However, photovoice's utility has not been widely harnessed in explorations of communication and media. Searches in popular databases reveal very few published articles that use this method in communication and media-related studies (see Novak, 2010; Singhal & Devi, 2003; Singhal, Harter, Chitnis, & Sharma, 2007; Singhal & Rattine-Flaherty, 2006; Wolfe & Novak, 2011).

This chapter continues to build on previous arguments (e.g., Novak, 2010) concerning photovoice's utility as a method needed to investigate communication and media phenomena. More than just an example of photovoice, this chapter will highlight the means by which interpretations and understandings of media can be explored via photovoice. Photovoice has great potential in media studies to (literally) see a variety of issues and context from a new perspective. Photovoice provides a new methodological twist to reception studies as well as other areas within media studies. By involving participants in the research process, photovoice increases participation with the potential of revealing experiences and situations that can extend theoretical knowledge. Ultimately, photovoice can reinvigorate audience reception studies as the method shifts interpretation away from a research structure dominated by the researcher.

Methodology

In order to explore the possibilities of using photovoice to study audience reception, we recruited 10 participants¹ for an exploratory study. We proposed two condition paths to explore photovoice's utility in this context, with half of the participants

taking part in one condition and the remaining participants in the second. The two conditions are potential variants of photovoice conceived by the authors based on prior photovoice projects and the uniqueness of studying media artifacts. In our study, five participants watched an episode of the HBO television series *True Blood* and used screen captures to talk about the show. Five participants used a more traditional photovoice approach whereby they watched the episode and then took photographs in the world of people, objects, and events that related to their experience of the television program. (For detailed procedures for this study, see Appendix A.) Participants were undergraduate students recruited from communication and media courses. No extra course credit was offered for their participation, though students did receive small gift bags. The next section briefly describes our rationale for choosing this particular text. A discussion of the specific details of each photovoice condition follows.

The Show *True Blood*

HBO's hit series *True Blood* has received abundant attention since its release in the fall of 2008. Based on a Charlene Harris novel, the series' main plot revolves around the people of the fictional village of Bon Temps, Louisiana, at a time when vampires – no longer dependent on human blood after the invention of synthetic blood by Japanese scientists – are trying to integrate into society. Main character Sookie Stackhouse, a telepathic waitress, gets involved with vampire Bill Compton. Their relationship evolves over several seasons, falling from one catastrophe into another. People around both Sookie and Bill get involved in the story, making room for several plotlines and more “creatures of the night” such as werewolves, shape-shifters, and fairies (HBO, n.d.). The series is directed by Alan Ball, who is also responsible for *Six Feet Under*. The show received a vast amount of attention (Moody, 2008), in part because of several elements that also make it an excellent case for our study: it uses technical innovations to create a highly visual spectacle; elements of this spectacle are sexualized; and the show must be understood in the context of its intertextual connections with other similar (and often highly visual) texts.

As a result of technological innovations in the TV industry, the use of special effects and other aesthetic elements has increased and gained importance over the years. In *True Blood*, these technological possibilities are exploited to a maximum. This turns the series into a true visual spectacle. Second, the danger *True Blood*'s characters represent generates a high erotic potential. The power of the vampires to “glamour their victims” (*True Blood*-speak for putting a victim's mind at ease) and the intimate bond that exists after a vampire drinks one's blood are both visualized in an erotic manner. Additionally, the show has elaborated on this theme by incorporating sexuality as a powerful weapon of many creatures (both human and nonhuman): seduction is often employed as a means to get one's way. Though explicit, the sex in

the show is of a certain aesthetic quality. Highly stylized visuals of sexually explicit scenes are part of the show's overall spectacular visuals. Finally, *True Blood* is a visual evolution in the lineage of vampire serials and can be read as intertextually related to other vampire stories, starting with Bram Stoker's classic novel *Dracula*, its multiple film iterations, as well as contemporary vampire television (e.g., *The Vampire Diaries*) (Beck, 2011; Hardy, 2011). Because these elements are so central to the show and because the show is so highly visual, exploring them through a visually driven method, such as photovoice, is likely to yield a deeper understanding of audience interpretations.

Combining Photovoice With the Reception Interview

We chose episode 10 of season 2 of *True Blood*, titled "New World in My View," as a strong exemplar of the elements just described. Moreover, as it is part of a narrative developed through a season, it is difficult to decipher exactly what is going on if one is not a regular viewer of the show, and we made this choice purposefully as we felt this would increase participants' need to interpret the show.

Here, we outline two ways in which the power of photovoice might be harnessed to deepen investigations of media. The first involves a more traditional take on photovoice. In this condition, students were told to watch the *True Blood* episode from beginning to end without pausing. Students were provided with paper and pen to take notes or record thoughts about what they saw. Once the show was completed, they were told to take photographs that captured what was important to their understanding of the episode. Participants were asked to choose a maximum of 20 pictures to discuss during the interview. Most interviews took place one week after viewing, which we judged to be an ample amount of time to allow participants to think about the episode as well as take photographs, while not allowing their memory of the show to fade significantly.

The second condition is rooted in traditional photovoice methodology but envisions new possibilities for harnessing photovoice for media studies research. In this case, students watched the stimulus episode in full. Participants were asked to capture images of the show itself via pausing and screen-capturing, either as they watched or after watching and reflecting on it. Students were provided with a notepad and pen in order to take notes about scenes, notable dialogue, and the like. They were encouraged to screen-capture images that were important to their understanding of the show or significant in their interpretation of the episode. These students were also asked to choose a maximum of 20 captures that best expressed their understanding. These captures were a major component of the interview, which took place directly after they finished watching the episode and taking captures.

The interviews were guided by a topic list (see Appendix B) that was sensitive toward whether participants took photographs or screen captures. We started the interview by asking them to recount what happened during the episode (e.g., what did they think was important, which themes were apparent to them, etc.). This retelling of the episode was based on Liebes and Katz's (1990) approach and was meant to give insight into initial starting points of meaning and sense making. This kind of interview is an example of an "active interview," in which both interviewer and interviewee engage in constructing meaning (Holstein & Gubrium, 1999). Next, we discussed the screen captures or photographs, engaging the interviewee in a narrative on the how and why of each capture/photograph and allowing the participant to reflect on the photovoice approach. This approach offered insights on the pros and cons of each method that might be applied more generally to media reception studies.

Results: Using Photographs to Talk About Television

In order to discuss the utility of photovoice in helping us understand participants' experiences of the text, we will discuss the findings of this project in two broad themes. First, we will address the potential unique contributions of this method both within and across the two proposed iterations of photovoice. Second, we will discuss the methodology's ability to inform our understanding of the aesthetic dimensions of a text. Of our 10 participants, two considered themselves fans of the show and had seen all or most of the episodes. Three participants had heard of the show and knew the basic idea (e.g., that it was a show about vampires) and had maybe seen a few episodes. These participants liked the fantasy genre in general, though sometimes preferred "softer" versions such as *Twilight* or *The Vampire Diaries*. Five participants had either only heard of the show but not seen any episodes, or knew nothing about the show at all. These five participants, in general, did not find shows in the fantasy genre appealing. There were both similarities and differences between the "fans" and "nonfans" of the genre in terms of how they used photos/screen captures to express themselves. Based on these findings, we will argue that our adaptation of photovoice is in some ways more suitable to investigate fans than nonfans of a certain genre or show.

We were impressed by the creativity with which all 10 participants took part in the research process. Participants taking photographs sometimes engaged in role-play, some involved friends, some went to visit certain sites to capture the images they thought they needed, others took photographs that they happened upon while going about their day. Moreover, each participant clearly used the method – either photographs or screen captures – in an individual manner to express their thoughts about the program. Their overall enthusiasm and creativity is indicative of the value

of photovoice as a media studies method. Additionally, all participants reported that having to take screen captures or photographs caused them to engage with the episode's content in a deeper way than they usually would. As one participant said:

Usually when I watch a show by myself, I'll get distracted from the visual part, because I usually catch on to whatever is happening by just listening to the audio part. I might grab my phone and I'll do a game of solitaire while I'm watching or listening. But during this process, because I'm supposed to be focused, I did not take my eyes off the screen. Or "Oh, let me see if I have a text message." I think that is a big difference in how I would usually watch.

While this participant usually does something else while watching television and focuses more on the dialogue than on what is shown on screen, she reported that she enjoyed paying careful attention to the visual content when participating in the study. This suggests that photovoice, on one hand, may fail to fully capture the "natural" way in which viewers normally watch television. It may, on the other hand, help focus their viewing efforts and foster more active and engaged viewership and reflection.

Almost all interviewees expressed some appreciation for the visual quality of the show. Each of them used screen captures or photographs to visually explain what they thought about the various elements of this episode of *True Blood*. Many photographs and screen captures depicted elements of the show the participants found enlightening, interesting, or funny. A few images related to scenes or images that participants found "disturbing" or "creepy" or that they did not like. Overall, we believe the photographs and screen captures enabled participants to express themselves more thoroughly regarding their thoughts and feelings about the quality, symbolism, and meaning of the show than an interview without photographs.

Using Photovoice to Express Manifest and Latent Themes

Our first theme covers the participants' discussions of content, its meaning, and their interpretations of the symbolic and narrative elements of the program. Since it is not our aim to unravel what meanings participants construct, but rather to focus on the process through which they construct this meaning using either verbal or visual means of expression, we will not delve into the "what" of these themes, but the "how." While we felt a more traditional interview would have sufficed for discussions of the *manifest* themes, the contribution of photovoice as a method became particularly clear in the discussion of *latent* themes in the show's episode. Manifest themes can be understood as themes that are obviously proffered by *True Blood*. These themes are what the show is about – the topics we find in the descriptions of the

serial's episodes. Latent themes, on the other hand, are more interpretive and less easily accessible in the text. Wester and Weijers (2006) refer to them as the meanings in a text that are shaped by contextual factors of production, such as genre, language, cultural habits, economic criteria, medium, and so on. These latent themes are commonly understood as the deeper layers of meaning in a text. Not all audience members engage with these themes (Fiske, 1987). We will nevertheless briefly discuss participants' engagement with manifest themes before moving on to address how they expressed latent themes.

Manifest themes are themes around which *True Blood* revolves. The "Other," good and evil, religion, and relationships (between friends and family) were manifest themes mentioned by most participants. In our study, both participants taking screen captures and those taking photographs used visual means to express their thoughts on the (manifest) themes, which is what we asked them to do. However, the ways in which they creatively expressed their thoughts via the photographs was particularly surprising and exciting. Figure 20.1 represents how Brittany interpreted an element of the show and translated that into a visual image. This participant talked about how she wrote the quote on the paper very neatly and then tore the paper out, ripped it, and wrinkled it to capture the flawed nature of human beings, as is also evident in the quote she chose.

In the other condition, a participant taking screen captures chose a specific scene to express her thoughts. Gina used the screen capture in Figure 20.2. She described

Figure 20.1 Crumpled paper that reads "sinners by default"

Figure 20.2 Screen capture of eye changing from black to white

how she wanted to capture this exact frame when watching the episode because you can just begin to see Tara's eye turning white (which means the curse that is on her is breaking). Gina stated, "I took this picture at this exact moment because it represents when you can see that there is good in her and that the evil is going away." Still, we feel that this manifest theme could have been easily addressed in an interview as well, without photovoice.

According to Beck (2011), manifest themes should be read intertextually. In this case, intertextuality is the understanding created about one text (an episode of *True Blood*), in relation to other texts. Fiske (1987) distinguishes between horizontal and vertical intertextuality. Horizontal intertextuality addresses *True Blood*'s meaning in relation to other programs in the genre (i.e., other primary texts), such as *Buffy the Vampire Slayer* and *The Vampire Diaries*. Vertical intertextuality focuses on the *True Blood*'s meaning in relation to other texts that refer to it, or "secondary texts." Secondary texts would be things like newspaper articles and pictures, and tertiary artifacts such as fanzines and blogs. We think that photovoice, especially at the vertical level, offers a small advantage over interviewing, as it enabled us to grasp the (visual) articulations of intertextuality by our participants.

For example, in discussing religion in the show, intertextual meanings became apparent. In one respect, this is not surprising, as religion is part and parcel of the vampire genre. Vampire stories relate to Christianity (e.g., you can ward off vampires with a cross or holy water), and religion and ritual were key elements of participants' interpretations of the episode. Multiple participants saw religious themes running throughout the episode, including, as Theresa stated, "religion, pagan religion, symbols, statues."

However, religion and ritual in *True Blood* are taken beyond their traditional or expected meaning. One particular element in the episode, a kind of totem pole, symbolized this exceptionally well. In the episode, the totem is built for the maenad Maryann who wants to evoke her god Dionysus through a sacrifice, which refers to ancient Greek mythology. Though some participants found this totem disturbing, most participants pictured it because it is an engaging visual feature: it contains meat, vegetables, some skulls, flowers, and fruit. All participants who took screen captures took a capture of the “meat tree” from one of the opening scenes of the show. Figure 20.3 shows a representative example of the screen captures. Similarly, even participants who took photographs remembered this scene. Multiple variations of the photograph in Figure 20.4 were taken by the photography participants. Some participants took pictures of lunchmeat packages, while others took pictures of their dinner with meat in it.

This meat tree, due to its disturbing nature, would also have been point of discussion if no photos or screen captures had been involved. However, participants taking photographs also elaborated on this theme with their photographs, making multiple mentions of religion. Consider the photograph of a lit cross that one participant came across while biking around town at night (Figure 20.5).

Due to the method used, participants taking screen captures were, of course, unable to take anything other than images available in the show. It is interesting, though, to see how, in that sense, the approach of manifest themes for the participants is highly intertextual: they read the ancient Greek religious theme in association with Christian religion and, ironically, their lunch (Beck, 2011). We believe this manifest theme would have shown up in interviews as well. However, the contribution of photovoice in this case is in the visual articulations of the intertextual meanings

Figure 20.3 Screen capture of “meat tree”

Figure 20.4 Photograph of meat in butcher's case

Figure 20.5 Photograph of lighted cross

Figure 20.6 Screen capture: seeing *True Blood* as a character

of a manifest theme proffered by the text. The photographs and their articulated meanings highlight connections to everyday practices, such as eating meals and walking around the city, and not only to other mediated texts and interpretations of the program. These results enlarge our understanding of intertextuality. This is a small but important extension of intertextuality that is made possible via photovoice. Photovoice's greatest potential contribution, however, rests in its ability to capture latent themes. Both participants taking photographs and the ones using screen captures touched upon latent themes that, they argued, would have been impossible to explain without the visual aids.

Gina, using screen captures, touched upon what she felt were different perspectives on the same "reality" the episode tries to provide for its audience. In the episode, a rather chaotic event, probably a Dionysian bacchanal, takes place. This event is shown in *True Blood* from various perspectives, giving the audience the opportunity to take the perspective of the people involved. The characters in the bacchanal – who are under maenad Maryann's spell – see the scene in orange and red lighting. The onlookers, who view the scene in its harsh reality, see as if they are viewing a first-person video game. This theme of the three different perspectives would have been near impossible to describe orally. As one participant explained:

GINA: I think this is how black-eyed people see it. I wanted to show the different types of how they see stuff. What I did notice is that the whole scenery and how we see it [as viewers] is really dark but whenever they [the characters] see it, it is all colory and yellow and green. Like, lots of colors.

INTERVIEWERS: Does that mean anything to you?

GINA: Well, not specifically that I can think of now. But it shows that there is a clear difference between how the people with black eyes see things and how . . . it really shows that there are two different types of people.

Participants taking photographs came up with latent themes in a similar way. For example, Ingrid took the photograph in Figure 20.7 because, as she explained, she felt that there was “something military” in the show – some characters reminded her of Vietnam vets. Nevertheless, she could not really explain why she thought about this theme: “It just stuck in my head.”

Using the visual tools clearly enabled participants to express thoughts and feelings about the episode that would have been difficult to explain or express otherwise. In the case of screen captures, participants could show us exactly which scenes or

Figure 20.7 Photograph: soldier's graves

images induced these thoughts. Participants using photographs had more time to reflect and process their ideas and thoughts, but still produced some photos associated with “vague impressions that stuck in one’s head.” In that sense, the contribution of the screen capture participants was much greater than it would have been in a “classic” photovoice approach (see Novak, 2010), as it allowed them to refer to specific visual elements that generated particular reactions and feelings.

While there are many similarities between what is gained via photovoice and what would be gained in a traditional interview when simply considering the themes of this television show, photovoice generates an additional layer of interesting data. As the examples of Gina and Ingrid demonstrate, participants often struggled with voicing and formulating thoughts on some of their own interpretations. Using the photographs and screen captures provided them with an additional means to explore and share these interpretations. The use of visuals might have also brought themes to the conversation that would otherwise have been ignored. The results of this small exploratory study do suggest that photovoice might contribute to a more in-depth and multidimensional understanding of what audiences do with the media products they consume. In addition to a discussion of the latent themes in the episode, the photographs and screen captures also elicited numerous comments on the aesthetic elements of the show.

Providing an Aesthetic Foundation

Regardless of the iteration of photovoice they applied, participants talked about how they saw the episode, the world outside of television, their relationships, and many other aspects of the text using visual language – both literally and symbolically. Thus, photovoice has great potential to move beyond an exploration of what themes participants might see in a particular show, toward a better understanding of *how* they see the show and interpret meaning visually – as this exchange with Tina illustrates:

- TINA: I don’t think I’d continue to watch this show. I don’t know. I like the whole vampire thing but I don’t know what it is about this show. Maybe because it is more adult or visually, things that I don’t like.
- INTERVIEWER: Like what?
- TINA: Well, there is a lot of blood and it’s all a little more extreme than what I’d normally watch. Like *Vampire Diaries* is at a bit more of a high level.

Regardless of whether or not participants liked the show, all of them showed appreciation of its aesthetic quality. Even when images were discussed as “disturbing” or “creepy,” they were still appreciated as “engaging.” For example, Theresa com-

mented that a screen capture of a vampire crying blood was an “important image.” As she explained, however:

- THERESA: Yeah. I think it is weird. Why is he crying blood? She’s making out with him. I don’t know.
- INTERVIEWERS: But the image of the man’s face with blood was disturbing or shocking?
- THERESA: Yeah. Right. Mostly shocking. Normally with vampire shows there might be blood around the mouth or something, but that he’s crying blood? That’s weird.

Many of the participants in both conditions commented and took photographs of the colors and lighting of the episodes which they connected to moods, emotions, and feelings that are supposed to be evoked by the show. Consider the following interview excerpt:

- THERESA: They work a lot with lighting and colors. For example, in darker areas – for example the scene at the house, it was only lit with candles and it gives a certain ambience, so to say.

Tina took a screen capture of the nearly complete blackness of one scene (a shot of what Sookie sees when she looks into Tara’s head) to talk about the darkness of the episode and the mood that it attempts to convey, and stated, “I think it was the lighting that created the mood about the show.”

Another participant, who took photographs, took a photo of the reddest item she could find (Figure 20.8) because the show was saturated with red colors and certain emotions that this participant associated with red.

- THERESA: Visually for example, the very first scene where she walks through this hallway. The warm. The colors. The red colors which create this rather warm but stuffy atmosphere and reminds you of blood. I like how they use the lights to convey a certain feeling.

Many participants commented on colors and darkness and how the show used these elements to portray a certain mood or feel. Participants took pictures of leather couches, bags, buildings, and trees to talk about the mood of the episode and how that was connected to color.

Another highly visual scene is where Sookie, who manifests as a fairy in a later season, attacks the maenad with a power coming from her hand. Multiple participants noted this scene. Figure 20.9 shows a representative screen capture of the scene. However, the aesthetics of the show were also sometimes the reason a participant might reject it. Ingrid called the show “over-dramatized” because of some of the visuals. Ingrid, along with a friend, acted out the picture shown in Figure 20.10. Ingrid

Figure 20.8 Photograph of red building on campus

Figure 20.9 Screen capture of lighted hand

Figure 20.10 Photograph of re-enactment of lighted hand scene

explained how the photo expressed her ironic view on this event from the show. The scene was “a bit too much” for her.

While Ingrid took an ironic viewing position (in the sense explained by Ang, 1985), some participants were embarrassed or shocked by some of the elements, causing a definite rejection of the show. The explicitly sexual scenes, in particular, evoked this kind of response. Interestingly though, participants also used visual means to point out exactly what it was they didn’t like. For example Mihaela commented:

This is a really scary scene. There is a guy with a shotgun watching this whole scene and he’s looking for action. And then you see these people and although they are doing normal party stuff probably in those weird clubs where I don’t go, what they do is normal, but it is still scary.

She, and another participant used screen captures to explain why she did not enjoy watching the episode. Some scenes were “too explicit, too much in your face.”

It is here that an interesting difference between fans and nonfans appears: the fans of the genre generally were enthusiastic about the aesthetic elements that cause nonfans to reject the show (and maybe genre). Fans of the genre, and especially fans of *True Blood*, called the show mature and saw it as aimed at an adult audience and therefore found it much more enjoyable than, for example, the *Twilight* series, which is aimed at teenagers. Similarly, the elements that Ingrid calls “over-dramatized” are

interpreted by fans as important additions to the show's quality. Helen, for example, explained how she felt about these visual aspects:

It's well done. It's well made. One thing about the entire show is that it really manages to capture an atmosphere. I do believe that by using different colors, and most of the time it's very dark but warm. It keeps up a balance between it is dangerous but also very loving. Visually, it is very well thought through.

To Helen, these elements are not "over-doing it" but show her how much effort, thought, and even craftsmanship went into producing *True Blood*. The aesthetic elements seem to be an important part of liking or disliking the show. Though this is a common element mentioned by interviewees in reception studies, we believe that using photovoice delivers a valuable contribution to understanding *exactly* how these aesthetic elements interact with interpreting media.

Another interesting difference between fans and nonfans that became clear through discussing the photographs and screen captures is the amount of attention paid to the aesthetic elements while they were viewing. Nonfans of the genre used their photographs and screen captures more often to express what they thought the show was about, touching on manifest, sometimes latent, themes. Take Ingrid, for example, who was not a fan, and her comments regarding the "meat tree":

INTERVIEWERS: Could you talk about what you remember about the show visually?
What did you see? What did you think about the visual aspects of the show?

INGRID: Uhhh . . . visually? I think some parts they captured quite well. Like the rituals. I think they made a tower of . . . what was it? Rubbish? Meat.

INTERVIEWERS: [Laugh] I think it was both.

INGRID: Yeah. It looked disturbing.

INTERVIEWERS: Did you like that? I mean, when you say disturbing, do you mean, they did it well.

INGRID: Yes.

Fans of the genre, however, used their photographs and screen captures more often to express all the reasons why they liked the show, including the aesthetic elements. We feel this difference is related to the ease or difficulty the participants had in making sense of the show. Participants who had never viewed an episode mentioned they felt "somewhat lost" and "in the middle of a season" (which was, of course, the case). For them it might have been a priority to make sense of "what's happening" first. Participants who were familiar with the show or genre obviously had less difficulty understanding what was going on. Having knowledge of the codes and conventions of a genre enabled them to interpret and construct their own view of the show. In other words, these results do suggest that our method might be more suitable to study fans of a certain genre than nonfans because the power and utility of

photovoice are harnessed when researchers want to learn from participants who know a subject well.

Discussion and Conclusion

Along with all of the usual benefits of photovoice – such as centering participant experiences and revealing previously unknown details outlined in other essays (Wang, 1999; Wang & Burris, 1994) – photovoice has great potential to develop and challenge theoretical and methodological perspectives within the realm of media studies. As other photovoice studies have noted (Novak, 2010; Wang, 1999; Wolfe & Novak, 2011) one of the strongest benefits of photovoice is that it allows knowledge previously inaccessible to the researcher to be illuminated. With only the 10 participants, our study yielded images and text that point to an increased ability for interviewees to interrogate and display what they meant when asked “Is this show good? Why?” and “What do you like about this show? What makes it better than other shows?” The participants were able to use and capture images to remember scenes and moments from the show and to connect those to their thoughts, emotions, and reactions. By using photovoice we were able to get at deeper levels of individual meaning as well as the complexity of individual interpretation. As such, we believe photovoice can be a fruitful methodological path for researchers to uncover theoretical complexity in virtually any media studies area.

Furthermore, we believe the visual element of photovoice highlight participants’ experiences and explanations of the aesthetic element of the show on multiple levels. Participants were quite easily able to grasp the manifest themes (e.g., good and evil, friendship, religion) of *True Blood*, even without background knowledge of the show. The ways in which they used aesthetics to talk about those themes were quite creative and enlightening. Both explicitly in their comments and visually in their photographs, participants were engaging the questions: What have I seen? What does it mean to me? How can I express that visually? This added a level of depth to the results and analysis that would not be available with topic-list interviews only. The photovoice interviews allowed us as researchers to explore aspects of the participants’ interpretations of the show that may not have come up otherwise. For example, when a participant took a dimly lit screen capture of a scene and discussed how that was a visual representation of evil or darkness, the photograph opened up a conversation with that participant: What about that scene was evil? What represented evil? What was good? This is directly related to the openness and ambiguity of photovoice, which researchers must be comfortable with when employing this method. Because photovoice opens up the conversation topically, there are great benefits to be had, such as deeper but more diverse results.

Having outlined the benefits and potential of using photovoice methodology in media studies, we would like to note some of the limitations and potential pitfalls

of photovoice in this context. From sitting in on each of the interviews and seeing all of the photographs collected in this project, we believe that the research process was more fruitful when the participants were fans of the show or genre. Participants did not have to be dedicated fans, but even marginal fandom or awareness of the basic themes, premises, and characters of *True Blood* resulted in a much more free-flowing and rich interview. In our study, participants were shown an episode that most had not seen before. This, in our estimation, impacted their ability to engage with and interpret the show. Participants who had no understanding of *True Blood* struggled to make sense of one mid-season episode of this show. Generally speaking, the photographs taken by participants who did not know *True Blood* were still creative and interesting, but these participants struggled to make sense of the episode. Furthermore, comments from the interviews indicated that people without background knowledge of *True Blood* had to work harder to pick up on storylines and characters and perhaps were less able to pay attention to the aesthetic elements of the episode. Using photovoice with participants who do not have knowledge of the context of the show may be more useful if participants were to document their thoughts on a full season of the show or on a pilot episode, where background information would play a less significant role.

Similarly, one limitation in this study seemed to be genre. The participants who stated they were not fans of fantasy generally seemed limited in their interpretations of the show, though the creativity of their photographs did not suffer. Participants who were not fans of *True Blood* or of fantasy in general seemed more likely to identify more superficial aesthetic elements and to not engage as deeply with the show. Thus, photovoice methodology seems to be more appropriate to tap into deeper sense making and interpretation elements for people who are more willing to engage with a show from this type of genre.

One other potential pitfall of this methodology has been noted in previous photovoice studies (Novak, 2010; Wang, 1999). It relates to the directions given to the participants and manifests itself in two ways. First, participants need to be educated that the camera is a tool that comes imbued with power. Participants – even young student participants who are used to having a camera on them virtually all the time – should be made aware of the power a camera wields and of potential ethical issues. One participant in our study took pictures of friends who were posing and re-enacting emotions from the show and, upon finding out that those photographs might be included in a book chapter, the subjects of the photographs politely asked that we not use any of the photos in question. Participants should be told up front and in no uncertain terms in what ways the photographs they generate might be used and what their responsibilities are as photographers. Likewise, participants need to remember to indicate to any subjects of their photographs how their images might be used. Second, multiple participants questioned whether or not they were taking the “right” or “correct” photographs or if they “were doing what we wanted them to do.” In similar projects we would try harder to make it clear to participants that we are interested in their interpretations and the connections

about the show and the life *they* are making, and that there are no specific “correct” answers.

One final potential pitfall mentioned in passing by a few participants was the content of one particular scene. In this scene, characters can be seen engaged in sexual activity, drinking, and rowdiness. Some participants did not care for this particular scene, while others found it entertaining. However, many participants, whether they liked it or not, recalled this scene, and some seemed distracted by the adult material of the scene. By asking participants to take photographs that capture the show for them, some participants may have spent undue attention on a scene to which they normally would not have not given much attention. So, in essence, photovoice might actually call attention to highly visual scenes that would otherwise go unnoticed by the participant or be unnoteworthy to them.

In conclusion, we think that photovoice is a useful methodological tool to deepen our understanding of participant experiences with, and interpretations of, different types of media. We think that an expanded role for photovoice methodology will be a beneficial addition to media studies in general and to reception studies in particular.

NOTE

- 1 All participants have been given pseudonyms for the purposes of this chapter.

Appendix A: Procedures

Traditional Photovoice

1 Project overview

- (a) This research is about how people experience media visually. We are going to show you a one-hour television show and ask you to think about and reflect upon that show visually. We are going to ask you to take photographs that document your thoughts, feelings and emotions about this show. So, while you are watching the show, please think about the images you see, what they say/mean to you and how you interpret what you see in the show.
- (b) We are going to show you one episode of a television show that you may or may not have seen. It does not matter if you are familiar with this show or not. Just watch the show carefully, listen, enjoy it and think about what it means for you. Once you have finished watching the show, we are going to ask you to take photographs to document how you experienced the show, what it made you think about and how it made you feel. You may take notes

- about the show and/or record thoughts about the show and what it makes you think about.
- (c) Do you have any questions about the procedures of this study thus far?
- 2 Television program
- (a) Participants will now be shown a one-hour television show. Participants can pause the show if you like and take notes.
- 3 Initial wrap-up
- (a) Participants will leave the viewing room and take as many photographs that capture their experience of the television show as they like, what it made them think about, what it inspired in them, what frustrated them, etc.
 - (b) Participants will be asked to select 20 photographs upon returning, but should bring all photographs they took with them.
 - (c) Emphasize that participants should feel free to think about what photographs they take, but that traditional measures of “good” photography are not important in this research. Participants should take photographs that capture their thoughts, feelings, emotions, etc. . .
 - (d) Participants will have 1 week to take photographs and will return the following week to complete the interview portion of the project and submit their photographs. Inform participants to bring their photographs with them on a USB drive or to bring a camera (and connective USB cord) with them.
- 4 Interview
- (a) Upon second visit, participants will choose 20 photographs from the photographs they took.
 - (b) Once images are selected, participants and researchers will proceed with the interview protocol (See Appendix B).

Procedures: Screen Capture

- 1 Project overview
- (a) This research is about how people experience media visually. We are going to show you a one-hour television show and ask you to think about and reflect upon that show visually. We are going to ask you to take photographs that document your thoughts, feelings and emotions about this show. So, while you are watching the show, please think about the images you see, what they say/mean to you and how you interpret what you see in the show.
 - (b) We are going to show you one episode of a television show that you may or may not have seen. It does not matter if you are familiar with this show or not. Just watch the show carefully, listen, enjoy it and think about what it means for you. While you are watching the show, we want you to pause the show and take screen captures of images of the show that are meaningful for you. Once you have finished watching the show, we will talk about the images that you captured. Capture images that document how you

experienced the show, what it made you think about and how it made you feel. You may take notes about the show and/or record thoughts about the show and what it makes you think about. Show participants how to capture images via keyboard shortcut. Leave written instructions on how to do capture image.

- (c) Do you have any questions about the procedures of this study thus far?

2 Television program

- (a) Participants will now be shown a one-hour television show. Participants can pause the show to take notes and screen captures.
- (b) During watching, participants should pay attention to the show and their reaction to the show. Participants should pay particular attention to the visual elements of the program (i.e., interesting, meaningful, frustrating, difficult images, etc.).

3 Interview

- (a) Upon finishing the program, participants will choose 20 screen captures (if more than 20 taken). Once images are selected, participants and researcher will proceed with the interview protocol (See Appendix B).

Appendix B: Interview Protocol

Questions About Experience With the Show

- 1 Have you seen this show before? This episode?
- 2 What do you know about this program?
- 3 Would you continue to watch this show? Why or why not?

Questions About the Program

- 4 Tell me what the show was about. What happened?
- 5 What aspects of the show did you find engaging? Not engaging?
- 6 What are the main themes of this show? Are these themes important to you?
- 7 What did you like about this show?
- 8 What did you dislike about this show?
- 9 What are your reflections on the visual elements of the show? How did the show look to you? What did you like? Not like?

Questions About the Photographs

- 10 Choose 20 photographs that represent your experiences watching the program and/or what the show made you think about?

- (a) Why did you take this photograph/screen capture?
- (b) What does this photograph/screen capture say about the show and/or what you got out of the show?

Questions About the Method

- 11 Did you find taking pictures/screen captures valuable? Why or why not?
- 12 Were you able to express information about the show (and your interpretation of it) via the photographs that you would not have been able to do otherwise?
- 13 What difficulties or challenges did you encounter when taking photographs/screen captures?
- 14 How did you go about taking your photographs? What kind of time span after watching the show did you use?

Wrap-Up

- 15 Are there any photographs/screen captures that you did not take that you wanted to?
- 16 Do you have any questions for us about this project or anything you experienced?

The Methodology of Online News Analysis

A Quantitative Approach to Ephemeral Media

Helle Sjøvaag and Eirik Stavelin

ABSTRACT

This chapter describes a new method for analyzing online news employing both human and computer coding and based on a triangulation of qualitative and quantitative measures. The chapter illustrates how the method was used to perform a content analysis of the full online news output of the Norwegian Broadcasting Corporation (NRK) for the year 2009 ($n = 74430$). It explains how the approach was developed, describes the problems we encountered along the way, and provides a rationale for further use of the method. We conclude that our work demonstrates that methodologies designed for measuring broadcast news do not suffice in the ephemeral online news environment. Thus, online research methods need to be redesigned to account for medium-specific news features on the Internet.

In this chapter we describe how we arrived at a methodology for analyzing online news quantitatively. The approach combines human and computer coding and is based on a triangulation of qualitative and quantitative measures. Used to perform a content analysis of a year's online news output of the Norwegian Broadcasting Corporation (NRK), the study reveals how methodologies designed for measuring broadcast news fail to fully address the ephemeral nature of the online news environment. Online research methods need to be redesigned to account for medium-specific features on the Internet. In this chapter we explain how the approach was developed through a mixed inductive–deductive design and describe the problems we encountered along the way – particularly relating to obtaining the data, defining the unit of analysis, designing the coding scheme, and testing reliability. We believe the appropriateness of the method lies primarily in the advantages offered by the computational ability to process large sets of data quickly and without errors, and thus aid in the analysis of online news media.

The Object of Research

The object of study is the online news services of the license-fee-financed public service broadcaster in Norway. NRK was established in 1933. Based on the BBC Reithian model to inform, educate, and entertain, it provides public service content primarily on three platforms – television, radio, and online. Overall, the Norwegian television sector is characterized by moderate competition within a fully digitalized broadcasting spectrum (Lund & Berg, 2009, p. 21). The market is dominated by four national broadcasters, with growing differentiation as a result of an industry-wide strategy that continues to see an increase in the variety of digital offspring and a plethora of international channels transmitted on the satellite and cable platforms. Nevertheless, NRK remains a steady leader in most content segments of the broadcasting markets, with an 86% audience reach for all platforms overall (Medie Norge, 2011).

In the increasingly platform-independent news market, however, NRK also faces competition from the national daily newspapers. As an online medium, NRK is second in the market, with 23.2% and approximately 830,000 unique daily users, behind the national daily tabloid *Verdens Gang* (VG), with 29.4% (TNS-Gallup, 2011). Our survey of NRK's online news at www.nrk.no was conducted using data from 2009 – data collected just prior to a significant restructuring of nrk.no as a publication platform. At the time, NRK was the fifth most popular online site in the country (TNS-Gallup, 2009). The data we present in this chapter is therefore not necessarily a reflection of the site's content profile today. However, the focus of the following discussion is the methodological development that led to the results, not necessarily the results themselves, although we find it likely that the need for methodological development in this case also led to some of our more interesting findings.

The Data

The following data sets were produced for analysis.

- 1 Text-based news articles published by NRK online during 2009 ($n = 74,430$). Based on the available data, we estimate that this is close to representing the whole production from 2009. Initially we received from NRK an index file containing 502,180 URLs published between 2002 and 2010. A search produced 73,497 texts for 2009, but among these we found only one economy article. This discovery revealed the lack of consistency in publication systems used across newsrooms within the organization. We obtained the economy content from NRK separately, making 74,430 texts in total. We have no way of knowing exactly how many texts are missing from the sample, but we estimate that 74,430 is close to the complete output. The data set was collected and treated by way of computer software custom written for this project, on the basis of an index file of published articles.
- 2 News articles published on 10 preselected dates in 2009, abstracted from data set 1 ($n = 2,162$). This data set consists of a representative selection of text-based news items published across a constructed 10 day period. The dates were preselected from the second week of each month. In three cases sampling had to be moved to the next week due to the lack of a complete set of front-page snapshots for the date in question (see data set 3). As time restraints limited sampling to 10 days, May and July were excluded as the least representative months (May because of the national holiday, and July because the general summer holiday left fewer journalists on staff). Every week day was represented¹ and the selection was predetermined – a Monday from January, a Tuesday from February, and so on. Because of lower publication frequency at weekends, the sample contains only one Saturday and one Sunday. Event-sensitive days such as Easter and Christmas were avoided. Data set 2 underwent manual coding and quantitative content analysis.
- 3 Top 10 news stories from the front page or main domain (www.nrk.no) ($n = 1,192$). The sample was compiled from the same dates as data set 2. Top 10 stories were collected once every hour between 09:00 and 19:00, in the form of image snapshots of the entire front page. Data set 3 underwent manual coding and quantitative content analysis.

Items analyzed were limited to the text-based news articles published on nrk.no, and did not include redistribution of audiovisual content from broadcasting to the Internet. Audiovisual news content on nrk.no amounted primarily to radio and television productions ported to the website for streaming. As we were looking to analyze the news dissemination of NRK's online news unit, we chose to overlook audiovisual content not primarily intended for the online platform and to focus on

NRK's textually mediated online news. The hereto relevant aims of the project were to assess the degree to which nrk.no presented a continuous and updated news agenda online during 2009; the thematic distribution of its news content; its front page priorities; the depth and perspectives of the news content; and the degree to which nrk.no used interactive or other Internet-specific tools in its news dissemination.

The quantitative and computer-assisted content analyses performed on the collected data confirm that nrk.no presented a continuous and updated news service during 2009.² The analysis also shows that the news content on nrk.no overall was characterized by a high level of local news. However, its front page bore all the hallmarks of a national online news site and was dominated by international news, politics, crime stories, and popular culture. As an online news medium, nrk.no used interactive elements only to a limited degree (see Choi, 2004; Nguyen, 2008). The website had a low external linking practice, and limited use of video and audio, quizzes, tests, and commentary (see also Barnhurst, 2010; Carpenter, 2010; Ureta, 2011).

All in all the study confirmed assumptions about the online news genre (Chung, 2007; Quandt, 2008), with short news stories averaging 260 words, "breaking news," and a high publication frequency with over 200 published texts per day. Findings were the result of method triangulation. We used an inductive design on latent content (content requiring judgment to assign coding values to news items, such as sports, politics, business, and crime) and a deductive design on manifest content (content that is observable and countable, such as hyperlinks, pictures, publication date, and author) (Krippendorff, 2004, p. 20; Neuendorf, 2002, p. 23).

The Problems

Overall the research design illuminated problems with transferring content analysis methods from audiovisual media analyses to the online environment. The analysis involves two different aspects of NRK's online publication. Both the front page (the primary domain www.nrk.no) and the website's "inside" – its deeper structure of subsites – were under investigation. Because our aim was to ascertain the extent to which NRK was able to utilize the unique potential of the Web in its news publication, and to establish a profile of its content, we were faced with a large starting point of over 74,000 unique items of data. From the outset we knew we were faced with several methodological challenges in this regard. In the following we expand on these problems under four different headings. We divide the problems we encountered into problems with obtaining the full population of data; problems with defining the unit of analysis; problems with designing an operable coding scheme; and problems with establishing intercoder reliability. In the end, these methodological challenges helped

provide some of the more interesting findings of the analysis of the online logic of NRK's news production, the subject of which we will return to in the conclusion.

Problem 1: Obtaining the Full Population of Data

Our first question on assuming the task of designing a workable scheme for analyzing online news was "What exactly is the object we are studying?" The issue is thus one of inclusion and exclusion. What counts as part of the news service we are investigating, and what falls outside the scope of our research interest?³

Most of the portals used by NRK to disseminate content online are produced and maintained using the same content management system (CMS), but not all. This raises problems when it comes to gathering the data for news analysis, where consolidation of overlapping content can quickly become a central task. When there are a multitude of subsites and portals such as on www.nrk.no, the act of choosing what to include in the study will impact on the result, especially if important subsections are overlooked. Our solution to this problem was primarily a pragmatic one. We first moved to ascertain an overview of the total output of material. This can be achieved manually or using a spider – referred to as "software that automatically enables Internet searches" (Deuze, 2003). However we opted to conduct a manual examination. We then chose to focus only on the large portals and subdomains that regularly add new data, making sure they are produced by as few CMSs and design templates as possible. This simply means that there are fewer "templates" from which to automatically extract the variables in the codebook, which simplifies the data collection procedure. As our aim was to analyze news output, we chose to overlook content associated with radio and television programs, blogs, and other aspects of the content production outside the news streams organized by geography, news topics, or the front page.

A further issue that soon emerged was what constitutes an article from 2009. One of the challenges of conducting this project was to collect data of online publication after the fact – from the previous year. Hence, one of our first concerns was whether we could obtain representative data. Contact with NRK enabled us to start with an initial data set consisting of 502,180 news items – given to us as links in an index file in XML format. From this we selected the subset of links marked as published in 2009.⁴ As we aimed to analyze a year in retrospect, we needed to draw clear boundaries as to what material to include in the sample of cases. A central question here is whether an article published in 2009 and updated in 2010 is to be considered part of the 2009 or the 2010 sample. However you choose to define the appropriate date of publication – original publication date or the date of the update – there are bound to be some, if minor, impacts on the results. We chose to define the sample by its latest date of update. Hence, stories that were published in 2008 and updated in 2009 were included, while stories that were published in 2009 and updated in 2010 were

excluded. Excluded stories comprised 4% of the material. Despite the margin of error introduced by this issue, the large sample size of 74,430 items published in 2009 counteracts this problem.

Our initial glance at the material revealed that some of the data that could be expected in the full 2009 collection was missing. For instance, only *one* of the 74,430 items was classified within the portal www.nrk.no/economy. When we requested the missing data from NRK, we soon discovered that their practice of using several publication systems had led to a lack of integration. Hence the total amount of published material remains unknown to us as well as to NRK. Based on the material we did receive, however, we estimate that the total of 74,430 unique links to articles (where portal pages and nonsingle news items were removed) is likely to be close to the factual total number of online news texts produced in 2009.

Dealing with Mutual Exclusion

An overarching problem with defining the sample based on URL links to news stories is the absence of mutual exclusivity as a publication or storage principle. In the online publication system, a news article can be in several sections at once. A story can be catalogued under both economy and domestic affairs, and it can be published on both subsites. NRK's website and many other websites identify individual stories or texts by a unique identification consisting of a string of numbers easily found in the URL, for example, <http://www.nrk.no/nyheter/okonomi/1.6923373> and <http://www.nrk.no/nyheter/norge/1.6923373>. This unique identification number enables registration independent of the rest of the URL. It makes the database recreation more complex, but keeps a tab on double posting. An alternative is to designate only one of the units as unique and to remove redundant URLs. This also removes the potential value of the categorization given in the URL. However, this phenomenon reveals more about how NRK's employees use the CMS and Web as a publication platform than about the content itself. And while interesting organizational questions can be answered through studying these types of actions, it falls outside the scope of this study. Hence, we removed duplicate URLs by a "distinct query" in our database, and kept only one URL for each story. The double postings amounted to 1,557 stories, approximately 2% of the material. This adds a systemic bias to the sample as we kept the URLs ranked first in alphabetical order. We decided on this course of action for the sake of simplicity and manageability, based on the fact that the number of double-posted URLs was low. By doing so we also kept the database structure on our servers in a single table format, and avoided recreating it with relations and keys. The idea behind the computer-supported analysis was to recreate as much data as possible based on the original database on NRK's servers. This entails collecting news articles from the Web and determining what constitutes the subsequent appropriate content for analysis. This process of delimitation is based on a combination of what we had access to and what we did not have access to, and the data we needed to answer the research questions. This raises questions as to how this transformation can be best operationalized.

Reconstructing the Database

The database itself is always the ideal data set for a content analysis of such a medium (unless the aesthetic or functional/interactive features are the focus of study), given that a website is only a representation of a database. A database dump containing both the structure and the content provides the best condition for an analysis that is precise and reliable. It also guarantees that all columns in the database are transferred. The disadvantages connected with such a database dump have to do with the complexities that occur in large databases of information systems used in news organizations. Resolving such complexities probably requires expert knowledge of the specific routines and practices of the information system and the news organization itself. Allowing a third party full access is itself rare, moreover, as such material comprises one of the more valuable resources of a news organization.

A recently developed and interesting approach in this regard is the (Web) API (application programming interface), an example of which is the Guardian Open Platform.⁵ NRK has announced it is working on developing such an API, without revealing too much of what it will contain, or if it will indeed be realized (NRK Beta, 2009). The main advantage of using an API is precision. A story is exposed through the API as structured information with metadata, as opposed to the results of a scraping procedure, where this structure needs to be created – a process that allows for a certain margin of error. The API approach would certainly provide a faster and easier way for researchers to access data, provided it contains the data required to answer the research questions. There is likely to emerge, however, uncertainties as to whether the API content matches the continuing flow of news on the front page or other central portals, but for an analysis of a website's "inside," an API remains a good option.

A third, less desirable, option for accessing the necessary data is to obtain an index file comprising a list of URLs intended for search engines, typically written in XML. An index will require a scraping operation using custom selectors to fetch the desired data. The advantage of the index file is that it often contains some metadata (e.g., dates) that can be useful. As a last resort, an index can be compiled using a crawler, spider, or robot – a computer program that browses the Web, typically in order to gather data to index for search engines. This method can potentially insure that links missing from an index, or that are not exposed through an API, are obtained, but it adds another methodological step and can be time-consuming and error-prone. This approach also requires a specific set of technical skills and could require a third-party technician. As metadata are lacking prior to scraping, making a subselection in the material (for instance, from a specific year or month) first requires scraping all links to establish the scope for the study. When it comes to obtaining the data, the closer to the original database you can get, the better the results you can expect to achieve. As we were unable to obtain a database dump, and NRK does not have a public API, we consider ourselves lucky that they had an index file. The solution was time-consuming, but worked well in terms of operationalizing our research design.

Analyzing Front Pages

The front page priorities of an online news site are essential for determining the content profile and frequency of publication of a national medium aiming for high visibility among online users. To be able to look back and see how a website looked day by day in the previous year is no small request. While services such as the Wayback Machine by the Internet Archive (<http://archive.org/>) continuously catalogue snapshots of web pages, it does not necessarily do so at frequent intervals, and thus does not provide material of sufficient scope for a content analysis. A register of website updates must be set up prior to data collection and kept running throughout the desired period of time. As our project launched only in late 2009, we had no possibility of collecting this data ourselves. Regular contact with NRK insured that we discovered that the broadcaster had itself recorded screen dumps of their front page every hour of every day. These records consist of large image files where all the information is stored as pixels, rather than as text and images in markup. We used these images to construct a sample for an analysis of the content priorities for the top 10 stories on the site – roughly equivalent to the “above the fold” priorities of the printed newspaper.

The Web is still a relatively immature and changeable arena. The limited possibilities for, and practices of, archiving online content put strains on the collection, handling, and use of data. Not only does the technology provide significantly larger sets of data, but the data also require a different type of classification and analysis (see Brügger, 2008, for discussion). The ephemeral nature of this material adds to the challenges when the analysis can be performed only the year after publication, as in our project. In order to penetrate the ephemeral nature of the online news flow, moreover, we first need to know what we are looking to analyze, that is, to identify the proper unit of analysis.

Problem 2: Defining the Unit of Analysis

We knew from the outset that we would have to account for the specificities of the online environment when designing our methodology. In the analysis of content in a newspaper or a bulletin broadcast, the data obtained on tape or on paper are fixed in time and unchangeable from the moment of publication. As it is not possible to edit analogue disseminated news *ex post*, the units of analysis remain open to inspection. Not least, it means the study is possible to replicate, a factor that increases its validity. The technological nature of the Internet means that online news differs from analogue news in at least two significant ways that are relevant to our study. First, the editorial moment is not frozen in time, which means multiple versions of the same story can exist of which only the latest publication is considered the “right” one. This raises questions as to the editorial institution of journalism. Internet technology changes the nature of journalism from a daily summary of the most signifi-

cant events to a continuous deadline of a potentially limitless number of events. A related second issue is the ephemeral nature of digital information itself. As noted by Michael Karlsson and Jesper Strömbäck in their study of website update frequencies, the question therefore becomes how to “freeze the flow” of online news (Karlsson & Strömbäck, 2010).

Karlsson and Strömbäck observe that there is a lack of viable research methods for investigating empirically the impact of the two primary characteristics of online news – interactivity and immediacy – on news content at the level of the individual report. They call for a strategy that can “freeze the flow” of online news so as to allow for the systematic content analysis of online news and their special characteristics (Karlsson & Strömbäck, 2010, p. 6). The Internet is first of all characterized by a lack of volume or space restrictions found in traditional media. Second, web technology does not make news organizations technologically bound to produce one original copy ready for replication at a specific moment in time. The Internet instead carries the possibility of fast, continuous publication with frequent updates – characteristics that engender traits of immediacy and interactivity in news dissemination (Deuze, 2003, p. 206; Karlsson & Strömbäck, 2010, p. 2; Nguyen, 2010, p. 224). “Freezing the flow” therefore represents the challenge to take the ephemeral nature of online news into consideration in content analysis of web media. As such it relates to a common methodological issue in all content analyses regardless of publication platform, namely the question of the unit of analysis.

Weare and Lin noted back in 2000 how the chaotic structure of the Internet complicates sample selection, and how the integration of technologies – what they refer to as text, video, graphic, or audio – makes the design of valid descriptive categories complicated (Weare & Lin, 2000, p. 273). They observe that

In traditional, linear forms of media, such as newspapers and television broadcasts, the boundaries of messages, such as a news article, are clearly defined. Similarly, the structure of newspapers and broadcasts are sufficiently standardized and their syntax is sufficiently well understood that defining the nature of a message’s context is straightforward. In contrast, the nonlinear nature of the WWW obscures the boundaries and environment of messages and involves more complex semantics. (Weare & Lin, 2000, p. 280)

One therefore has to take great care when defining the unit of analysis in the study of online content. For instance, Weare and Lin describe a web page as “a highly aggregated recoding unit,” equivalent to a full newspaper article (p. 282). In order to design a valid coding scheme for an online news article, they say, we need to define smaller recording units based on an understanding of the site’s underlying structures (p. 83).

One of the more specific problems we encountered in this regard emerged during the manual coding of the front page of nrk.no. It concerns the boundary between update and publication. The issue was essentially the question of what constitutes

an update to a story. At what point is an update significant enough that it becomes a “new story”? This is one of the more problematic discussions regarding the unit of analysis in front page analysis of online news, and as publication frequencies escalate, it will continue to present problems. A heavily covered story, such as a political press conference, from which every update is logged as a new story, will increase the number of political stories in the sample. Compared to logging such new items as updates to one story, this increases the visibility of “politics” in the resulting analysis – possibly making it seem as if the website is primarily dominated by journalistic content of high legitimacy, providing you measure content in “instances” rather than in “volume.” Hence, it must be considered what coding practices most fairly reflect the content of the website. A likely dilemma to consider here is the case of the continuous coverage of a sports event. As an illustration, we decided to draw the line between update and “new story” at the point where the narrative changes. For instance, in the event of a football game there is likely to be an original narrative in terms of “preparing for the game.” Once the game is underway, a new story is logged where reports on goals scored constitute updates rather than a new story. Once the game is over and the narrative changes from “playing the game” to “won the game,” another unit of analysis is collected for coding. The boundaries between narratives are, however, highly permeable and coders need to take great care in the coding process, noting precedence that they subsequently follow diligently.

Ultimately, the unit of analysis on the front page was defined as headline and image. For the “inside” analysis we defined the unit of analysis as the full article after boilerplate removal. Weare and Lin’s points regarding syntax and structure of news messages are key entry points to the computer-assisted analysis of online news in this regard. Here, the standardization and syntax of online news as offered by rigid CMSs and standards like HTML provide the predictability necessary to conduct this kind of analysis efficiently. Large websites such as news portals produce a predictable syntax for most of the content that is published through the system. Journalists usually do not write HTML, but rather enter text into forms in CMS that store the text in a database. When the CMS outputs the content from the database to the website it loops through the same tables each time. These are printed in HTML in a design template that provides a custom look to the news brand. The template’s structure or syntax can be recognized by software, allowing us to recreate the database – or the underlying structure of the news publication – for research purposes.

Problem 3: Constructing the Coding Design

How a coding scheme is designed depends at least in part on a preconception of the characteristics of the messages you are studying (Weare & Lin, 2000, p. 284). We therefore need some basic assumption of what constitutes news and news-related content. News production is one of the more legitimating production activities a

media organization can engage in, and is particularly important for the legitimacy of a public service broadcaster. NRK's bylaws state that the broadcaster "shall support and strengthen democracy" by facilitating public debate, provide sufficient information, cover elections thoroughly, uncover critical issues, and protect the public from the abuse of power, and that it do so with editorial independence, balance, integrity, and credibility. The bylaws also state that NRK should provide an updated service of regional, national, and international news on the Internet and on mobile devices. Provisions specify that these services should provide factual and background information related to news, debates, and current affairs. Moreover, these services should encourage interactive participation and "stimulate knowledge, understanding and use of other media platforms by users of all ages" (NRK, 2012). This is the vantage point for the research design, and the background against which we conducted our analysis.

As a similar study of online news on this scale had, to our knowledge, not been previously undertaken, few model research designs existed that could be used for the purpose of this analysis. A design outline was therefore formed on the basis of a previous quantitative content analysis of Norwegian television news (including NRK news) (Waldahl, Andersen, & Rønning, 2002, 2009). A general orientation within the medium in question, along with a short pilot study, enabled us to ascertain the medium-specific variables that were viable for automatic coding by computer, and the variables that needed human coding. Coding schemes for online specific news markers, such as interactive elements and update frequencies, had to be designed from scratch. This process was facilitated by frequent contact with NRK staff who willingly answered technical questions.

Relevant here were, for instance, questions regarding the subdomain practices within the organization – for example, to what extent were nrk.no/economy and nrk.no/foreign used consistently by publication gatekeepers? NRK has two main publication channels online – a central editorial function for nrk.no that was only semi-operational at the point of our analysis, and 13 district offices each with its own editorial gate. Local offices (for instance, nrk.no/hordaland) have a "front page" of their own, where stories produced by local journalists are published. From there, stories can be moved to the front page if the story is found fit by a central editorial staff in the capital, Oslo. Other questions that were resolved through contact with the organization ranged from technical issues such as how the organization had stored the data, to more journalistic issues such as sourcing routines in cases of wire material. In the latter case, practices turned out to be so inconsistent that data measuring of the number of wire stories in the sample had to be discarded. Contact with the organization can therefore be a great facilitator as well as a time-saver.

Based on a survey of the environment and the blueprint provided by the Waldahl et al. (2002, 2009) design, we ended up with a coding scheme consisting of approximately 50 mainly categorical variables, each with up to eight subcategories. Manually coded data were logged in the statistical analysis tool SPSS. The variables for the three separate analyses are set out in Table 21.1.

Table 21.1 A selection of coding variables for front page and content analysis, and computer-assisted coding

Front page analysis	Content analysis	Computer coding
Publication date	URL	URL
Headline	Headline	Unique ID
Priority on the page	Domestic/foreign	Publication date (hour/minute)
Priority change (up/down)	Location (country of topic)	Update (hour/minute)
Domestic/foreign	Economy	Number of interactive elements
Economy	Crime	Commentary/debate section
Crime	Social issues	Game elements
Social issues	Politics	Poll
Politics	Accidents	Video
Accidents	Culture and entertainment	Picture gallery
Culture and entertainment	Sport	Flash file
Sport	Weather	Number of words in the article
Weather	Science and technology	Number of links in the article
Science and technology	Genre (news, features, etc.)	Internal/external links
Promo (for own programs, etc.)	Topical (on the agenda)	Local/central office affiliation
Story updates	Context links (similar stories)	TV/radio program affiliation
Links		Sidebar (links to similar stories)

Some of the variables provide simple manifest data that log characteristics of the texts – such as publication date, unique identification, and the number of links in the text. Other variables allow for coding of latent content, and contain up to eight subcategories further defining the themes.⁶ For instance, included in the social issues category are topics related to the health sector and the education sector, stories about working life, and minority, consumer, and environmental issues. The thematic spread of this category caused some problems in the testing of intercoder reliability, as we explain further under Problem 4 below. Doubts would arise in the frequent cases where welfare state issues (for instance, budget deficiencies in the hospital sector or labor strikes) involved politicians and/or government ministers. The codebook specifies that such stories be logged according to sector (health sector, work sector, education sector, etc.) rather than the level of political controversy. The complexities associated with these journalistic areas nevertheless posed challenges for the coding of latent content.

Making Coding Scheme Adjustments

The research design had to be adjusted somewhat as the coding process progressed. Some variables were too time-consuming to log and were removed. A relevant example here was the variable registering human sources. Other aspects of NRK's news dissemination were so specific that we had to establish new categories to capture these profile-building features of NRK's online news coverage. Items that were added include sidebar functions and specific contextual linking practices tying

articles to previous stories of a similar topic. We also added a few subcategories under the content variable – most notably the subcategory “media” under the “culture and entertainment” category, the subcategory “traffic” under the “social issues” category, and the subcategory “misdemeanors” under “crime.” These were added to the coding scheme *ex post* to facilitate differentiation of inflated “other” categories under culture, social issues, and crime. Some of these “other” categories approached 30% of the coverage, which presented a problem for the validity of the coding design. We therefore proceeded to comb through each of these categories in search of topical clusters that could be extracted from the material. Such *ex post* coding is, of course, problematic. However, it is also necessary in order to establish a viable content profile. Provided all precedents are noted and followed consistently, the result should present few problems in terms of the overall validity of the study.

What we can conclude from such methodological findings is, first, that the online news medium allows for a greater diversity of content than broadcast news. Second, this necessary adjustment of the coding scheme reflects the extent to which NRK’s online services communicate the organization’s local news profile. NRK is a national institution that is made up of 13 district offices each of which produces local television and radio news bulletins daily, and therefore also publishes local news online on a daily basis. As the necessary coding adjustments reveal, local news carries different characteristics from what the national agenda-based coding scheme allowed for. Whereas traffic violations and road work are reported frequently enough in local news to warrant additional “misdemeanors” and “traffic” subcategories in the coding scheme, such instances appear so seldom on a national news agenda that here they fall appropriately within the category “other.”

When we decided to base the coding scheme on a previous codebook designed for the analysis of television news, the assumption was that latent content categories and other news-related variables appropriate for NRK’s traditional broadcast news would also suit the purposes for the study of its online news output. As demonstrated, this proved to be true only to a certain degree. The basic latent content categories used – such as economy, politics, and crime – are comprehensive enough to apply in most studies of news content. However, in this study, assumptions regarding content profile and the latent and manifest variables created problems both in the data collection process, in the coding process, in the analysis, and in the reliability testing. The fact that such design transfer did not create more problems than it actually did – complications that could indeed be solved – was an interesting analytical finding. It speaks to the endurance of news as a particular narrative form. Hence, news media do not only carry different characteristics across publication platforms, but they also share a great many features, particularly in terms of genre traits, communicative forms, journalistic standards, and overarching institutional practices.

Establishing the Computational Coding Design

In the computer-assisted coding process, the selection of manifest variables to map the use of interactive features and linking practices on nrk.no was done more or less

in the same way as a web scraping. Here, we parsed HTML to obtain the data we were after by writing selectors that recognize data sought in a markup-based document. The data sought amount to categories in the codebook, or the properties of the articles that can help us answer the research questions. As both research questions and markup will tend to vary from project to project, some custom tailoring is likely needed, also in cases where the object of research uses multiple CMSs or radically different design templates. In this project we wrote the software selectors in free open software: the Python⁷ programming language with the screen-scraping library BeautifulSoup.⁸ The program looped through the entire folder of downloaded web documents and fetched the items identified by the categories in the codebook. An example of a selector looks like this:

```
if soup.find("div", { "class": "article" }) > -1:
    article = soup.find("div", { "class": "article" })
    for tag in article.findAll():
        if tag.name == 'h3' and tag.renderContents() == "Gi din karakter:":
            poll = poll + 1
            interactive = interactive + 1
```

In this example we are looking for a div-tag with a class of articles in a BeautifulSoup object named “soup” that contains a single article in its entirety. We loop through the HTML tags inside this div-tag. If one of these tags is an h3 tag (a header) displaying the text “Gi din karakter:” (meaning “Rate now” – the design template insures this header appears every time a poll is used) we add the value +1 to the variables registering “polls” and “interactive features.” In this instance, we considered a poll with a voting option an interactive element. At the end of the loop the values from all the selectors – one for each item in the codebook – are saved and the next article is subjected to the same treatment. The key to this process is to find ways to identify “smaller recording units” (Weare & Lin, 2000, p. 83) in the web documents and to write this identification process as selectors as in the example above. The result of the process is written to a CSV file – a file option that insures that the results can be imported into a variety of computer programs, such as the SPSS statistical program Excel, and to databases (e.g., MySQL or Access). This gives each member of the research team the flexibility to work with the data according to personal preference and methodological orientation.

Problem 4: Measuring Reliability

Quantitative content analyses should always report validity as measured by inter-coder agreement. Reliability reporting increases the validity of the analysis and contributes to the further improvement of the method within media and communication studies. A premise for reliability measures is testing the extent to which two

or more coders can be said to agree on the meaning, and hence coding, of latent content. For the analysis to be valid, we need to have the same understanding of what constitutes political news, what constitutes an updated story versus a new story, as well as to agree on the differences between an article and a short bulletin. We operated with a wide definition of news and have therefore included items beyond the traditional hard news genre. Exceptions to this inclusive practice have been topics such as gardening, cars, horoscopes, TV guide, and so on. This division can be seen as problematic to the extent that many newspapers today carry separate sections with just this type of content (see Harcup, 2004). However, as our object of study was connected with the broadcasting medium, these content types were associated more with specific NRK programs (and their Internet sites), rather than with the news dissemination of NRK online.

Due to limited resources, we used only one primary coder in the manual coding process. For the content analysis $n = 2162$, intercoder reliability was tested on 100 units. We also tested 100 units on the front page analysis, $n = 1192$. The reliability testing displayed some of the problems that might arise from using only one primary coder. Kappa⁹ was achieved for none of the 14 variables tested in the first reliability test, with 9 variables measuring below .50 (kappa ranged from .20 to .67, and from 60% to 94% agreement). As raw agreement here was acceptable in most cases (with the primary content variable and social issues the only variables scoring below 70%), we assumed low variance to be a contributing factor in addition to inadequate coder training. Cohen's kappa has been criticized for being somewhat conservative, and often results in low variance in studies such as ours. Therefore, we set validity measures at above .70 for kappa and above 70% for raw agreement. To attain reliability above .70, a second reliability test was, due to restricted resources, performed by one of the authors, and resulted in acceptable kappa (between .43 and .86) and raw agreement (between 67% and 97%) for all variables except social issues, which still measured low at .61/67%. A third test measuring only the primary content variable was performed by two of the senior researchers to secure intersubjectivity within the project, and reliability was attained at .75/79%. The struggle with achieving reliability for the content category "social issues" not only revealed the fragility of using only one primary coder; it also illuminated the problems associated with using such a thematically wide category for content coding.

The reliability of the computer-assisted coding was not tested in this study, primarily due to restricted resources. It should, however, ideally be done. We would suggest testing precision and recall values (Baeza-Yates & Ribeiro-Neto, 1999). The main advantage of computer-assisted analysis is scale, as a larger number of items can be processed more quickly and with greater precision by computers than by human effort. In traditional content analyses the size of the sample correlates with the certainty of the numbers. This favors automation as we can perform analyses on more units in less time. It also makes it harder to find and pinpoint errors post run time,¹⁰ as the data set very quickly becomes very large. A test of the accuracy of the selections and quantification of attributes could be given as a percentage. This can be

done by testing the algorithm on a data set of known manually categorized material, and comparing the manual with the automated result. This is similar to a recall value in information retrieval (Baeza-Yates & Ribeiro-Neto, 1999). Such a statistical classification is a meaningful way of measuring the accuracy of the algorithm and the quality of the compiled data. Particularly if selectors aim for latent content, where the results are expected to be poor, a measure for the algorithm is needed. In such cases, a variation of a precision value would be appropriate.

In formulating the selectors, tests and adjustments are necessary to achieve sufficient flexibility and precision. All selectors in use should be tested. A manual examination of the results produced by the algorithm is required here. Errors will be quantified if allowed, so iterative testing – from single units to smaller samples and random samples of the entire material – will insure consistency throughout the project. Multiple testers should participate by looking for errors in a processed sample. The aim is to insure that the algorithm is precise to a degree that exceeds the precision of human coders.¹¹ For manifest content the aim should be 100% agreement – a feasible goal if the CMS prints content in a consistent way. Testing results will vary from news site to news site, and between different software approaches. A test to formally validate the precision of the algorithm and accompany the results will strengthen the credibility of the research findings.¹²

Results and Findings

In this chapter we have outlined the major problems we encountered when performing a content analysis of a year's output of online news produced by the public service broadcaster NRK. The problems were primarily connected with obtaining the data, defining the unit of analysis, designing a viable coding scheme, and with achieving intercoder reliability for the coding design. The problems we encountered were specifically related to our attempt to transfer a content analysis designed for television to the online medium. As Karlsson and Strömbäck emphasize, the dilemma with researching journalism online is how to “freeze” the flow of news so that it becomes viable for coding and analysis. Here, we have employed a computer-assisted approach in combination with a traditional content analysis methodology to attain such a freeze – one instant being 2009 in retrospect through an index file, and the other being the front page hour by hour in pixilated format. This computer-assisted intervention into the material has been the method by which we have endeavored to indeed “freeze” the news flow and thereby to handle the ephemeral nature of online news.

Because of this approach, the problems created by the ephemeral nature of online news also produced results in the analysis. As we adjusted the research design from television to online, we also adjusted our methodology to the grammar and logic of online news. Large numbers of stories that defied categorization not only illuminated

problems with the national agenda-based coding design; it also helped uncover how the public service broadcaster was adjusting to an online news agenda. When measuring the update frequency among the top 10 stories on the front page of nrk.no, we found that 36% of all stories were new in the sense that they had been published within the last hour. Hence if you were to check nrk.no every hour during 2009, you would on average find that each time you entered the site, 36% of top 10 stories were new. The results also showed the pace of publication, where 79% of top stories were replaced with a new top story, every hour. Thematically, above-the-fold stories largely followed the typical online news agenda of event-centered and easily digestible news. Sports was the largest content category among top 10 stories on the front page with 23% (followed by crime with 19%) but failed to reach the top five as often as crime stories or politics. If we focus on only the very top of the page, Figure 21.1 shows the distribution of content between the top five stories on the front page.

We also found a clear difference in editorial or journalistic priorities between news on the front page and news on the website's "inside." For one thing, while the front page contained 23% foreign news, only 2% of stories published on the inside were international in scope. This can perhaps be explained by referring to the local office production structure of the website, where approximately 80% of all content published during 2009 was produced by one of NRKs district offices. This production reality was also reflected in the thematic distribution of content, with a predictably heavy emphasis on social issues and local politics on the "inside," and an overemphasis on murders and suspicious deaths on the front page. Figure 21.2 shows the difference in thematic priorities between the front page and the "inside."

Figure 21.1 Front page priorities, top five stories ($n = 119$)

Figure 21.2 Share of stories on the front page ($n = 1192$) and the content ($n = 2162$)

As for the results of the computer-assisted coding, the analysis revealed some predictable patterns in the website's use of features that allow for user involvement, and in terms of external linking practices. Research from the last decade has shown that traditional news media's utilization of unique web-specific aspects such as interactive options for users, multimedia features, and various forms of participation remain scarce (Choi, 2004; Karlsson, 2010; Nguyen, 2008; Rosenberry, 2005). In particular, studies consistently find that the use of external hyperlinks remains low (see Barnhurst, 2010; Carpenter, 2010; Dimitrova, Kaid, Williams, & Trammell, 2005; Engebretsen, 2006; Oblak, 2005; Ureta, 2011). In the case of nrk.no, the analysis of news output for 2009 showed that 52% of stories contained no hyperlinks. Many of the published news items can be described as short notices where linking would not be considered necessary. However, the fact that only 12% of stories contained hyperlinks to external websites reflects the scarcity of the external linking practice in the organization's online journalism. As for interactive features, nrk.no displayed a relatively low use of features that allow for user engagement during their 2009 news coverage. "Interactivity" is, of course, a highly contested and notoriously amorphous term. In practice we chose to include in the measure the (widget) elements that appeared in the sample. Hence we dealt with interactivity as a fixed set of story-centric elements that require the user's action (e.g., a mouse click) to trigger extra content related to a specific story. This includes the use of video, audio, navigable

Figure 21.3 Interactive features on nrk.no during 2009 ($n = 74,430$)

photo galleries, polls, games, and so on. Figure 21.3 shows the frequency with which different interactive elements were utilized in the NRK's online news coverage during 2009.

Conclusions

An analysis of digital media is unavoidably also an analysis of the information system through which the media content is distributed and consumed. The efficiency of web publishing, where immediacy emerges as a key news value for online content, relies on the predictability and rigidity of a CMS. The same predictability and rigidity allows researchers to apply computation to analysis of the same material. Understanding the information system underlying news production and dissemination contributes to our understanding of how media is accessed, of the limitations posed on news by technology, and ultimately of the media content itself. Emerging online news production practices can therefore be seen as inherently tactical adjustments

conducted by media institutions in adapting to a competitive market. While endless space for elaboration, analysis, discussion, and background information is one of the possibilities offered by the online news endeavor, speed is regularly chosen over depth. While findings from our project may suggest that being first takes precedence over having the broadest coverage, the local–national duality in the content profile also suggest the presence of conflicting ideals in the editorial decision-making routines. For a license-fee-funded broadcaster, the online remit presents a dual challenge to fulfill public service obligations while competing for audiences on the national arena.

What this project, and the convergence between conventional content analysis and computational methods, demonstrate is that whereas the ephemeral nature of online news may create a new grammar of news dissemination that requires new methods and theoretical frameworks, the form of news as an institutional product is also an enduring one that warrants attention in terms of analysis in such studies.

ACKNOWLEDGMENTS

The research presented in this article was funded by the Norwegian Media Authority. The authors wish to thank Dag Elgesem, Hallvard Moe, Maren Agdestein, Joachim Laberg, Linn Lorgen, and Gyri S. Losnegaard.

NOTES

- 1 The dates were: Monday, January 19; Wednesday, February 11; Thursday, March 12; Friday, April 24 (selection moved one week because of Easter); Sunday, June 21; Tuesday, August 18; Wednesday, September 16; Thursday, October 15; Friday, November 13; Saturday, December 5 – one Monday; one Tuesday; two Wednesdays, Thursdays, and Fridays; one Saturday; and one Sunday.
- 2 This chapter is based on findings from a project conducted by a team of researchers at the Department of Information Science and Media Studies at the University of Bergen. Previous publications from the project present findings in greater detail. See Elgesem, Moe, Sjøvaag, Stavelin, Agdestein, Laberg, Lorgen, & Losnegaard, 2010; Sjøvaag, Moe, & Stavelin, 2012; and Sjøvaag & Stavelin, 2012.
- 3 As is the case with many online sites, www.nrk.no has multiple portals (examples include www.nrk.no/sport; www.nrk.no/economy; www.nrk.no/election09) which reorganize content that can also feature in short form on the front page. The same type of organization is found in the site's characteristic geographical subdivisions (such as www.nrk.no/hordaland; www.nrk.no/nordland). This geographical division of published online content is based on the broadcaster's organization into 13 local offices spread around the country. Hence, nrk.no is primarily organized into two subdomain structures – one based on thematic categories, and one based on production location, both of which restructure content easily identifiable as news.

- 4 These were downloaded to our server by GNU Wget, a process we intentionally slowed down to spare the NRK servers from unnecessary strain. The collected data took approximately 4.2 GB of space, and were collected over a period of five days. Unwanted bits of the downloaded files were removed in a “boilerplate removal process” (Fairon & Naets, 2007) where everything but the news article text was removed from the sample – for instance, headers, footers, and menus. The boilerplate removal was undertaken to save space and time and to remove unnecessary complexity in the further treatment of the collected material.
- 5 See <http://www.guardian.co.uk/open-platform> (accessed August 12, 2013).
- 6 For example, stories logged as culture and entertainment include reports from the arts sector and popular culture, news about the royal family, portraits of celebrities, and curiosities. Topical issues in the content analysis coded for long-term agenda setting and included the financial crisis, the national election, climate change, Barack Obama, the Iranian election, and the Muhammad cartoons crisis.
- 7 See www.python.org for downloadable installer and information.
- 8 <http://www.crummy.com/software/BeautifulSoup/> (accessed August 12, 2013).
- 9 We used Cohen’s kappa (k) to measure the agreement between two coders who independently assign values to items applying codebook variables that are mutually exclusive. Kappa calculates intercoder agreement by dividing actual agreement by chance or random agreement, arriving at observed agreement (Krippendorff, 2004, pp. 245–247).
- 10 This is the time during which a program is executing.
- 11 In all aspects that do not require human judgment. Make sure all selectors aim for manifest content. Latent content selectors will need a more solid documentation of precision.
- 12 To better reproduce the results, the selector code could be added to the report, or even published as an open-source project. This will further strengthen the credibility of the findings.

Digital Ethnography and Media Practices

Elisenda Ardévol and Edgar Gómez-Cruz

ABSTRACT

This chapter deals with ethnographic methodologies used when studying digital media, social contexts, and cultural practices. The chapter starts with an introduction to ethnography and its challenges when going digital. It then provides an overview of the different approaches to digital ethnography depending on the object of study: (1) the ethnography of online communities, virtual worlds, and social media sites; (2) the connective ethnography proposal through online and offline field settings; and (3) the ethnography of everyday life and the issue of audiences and creative practices in digital media. Finally, we discuss methodological issues relating to how to conduct online ethnographic fieldwork, including participant observation, interviews, as well as digital tools for registering, analyzing, presenting data, and some ethical considerations.

Introduction

Since the emergence of computer-mediated communication (CMC), and especially since the spread of Internet use and the World Wide Web boom, scholars and institutions have been interested in studying the social processes that accompany the devel-

opment of these digital communicative and informational technologies (Silver & Massanari, 2006; Wellman, 2004). A growing body of work consists of methodological and epistemological reflections on how to study such phenomena. From many different disciplinary and theoretical perspectives, ethnographic methods have been used as a research strategy to study uses of the Internet, online social practices, and how people engage in networked relationships, and to account for the moral order of their activities (Lindlof & Shatzer, 1998; Mason, 1999).

At the same time, the cultural turn in communication research has raised the status of ethnography as an adequate methodology for studying the conditions of production, reception, and consumption of media. Media ethnography seeks to develop an understanding of active audiences by exploring genre readings, issues of race and gender, family living, and identity, in order to understand media as a cultural form (Murphy, 1999, p. 207). As a consequence, the ethnographic approach is well established today among the social sciences and its different fields of research, including Internet studies, the social studies of technology, and communication and media studies.

The conventional notion of ethnography within anthropology, as epitomized by Bronisław Malinowski's work, implies the understanding of cultural formations from an experiential point of view. Ethnographers must attend to people's sayings and doings, including their material condition of existence and their worldviews: how people build meaning in relation to their experiences and actions. Participant observation and in-depth interviews are at the core of ethnographic fieldwork. Through participant observation, ethnographers gain access to people's ways of life, not only by observing behavior but also by sharing their daily life routines and social meanings. In this sense, ethnographers' subjectivity and socialization play an important role in the construction of ethnographic knowledge (Lee & Ingold, 2006). They are not factors that should be avoided for the sake of greater objectivity but constituent elements that have to be controlled and put into work in the data analysis and interpretation (Bateson, 1972). The result of ethnographic fieldwork is a theoretical description of the cultural patterns that cross-cut different domains of social activity. Therefore, the ethnographic perspective is anchored in the "grounded" experience of the ethnographer, as well as being contextual and holistic in its scope.

Moving this ethnographic approach to the study of the Internet poses many methodological challenges. What is the purpose of Internet ethnography? How might the traditional methods in ethnographic research be used in online fieldwork? Are there other related methods that are specifically needed to study Internet communication? These kinds of questions have brought to the fore the need for methodological reflection about the specificity of the medium. Different categorizations such as virtual, connective, hypermedia, netnography, or digital ethnography had been proposed to indicate the particularities involved in "adapting" the ethnographic method to Internet research.

This chapter explores some of these different approaches to ethnography and how they also imply different ways of understanding the Internet as a field and object of

study. We propose the term “digital” to embrace these varieties of Internet-based research approaches because it is more semantically neutral and more useful to refer to the different practices and contexts mediated by digital technologies.

Digital Ethnography

Christine Hine (2000) argues that the Internet, as an object of study for the social sciences, has been theorized in two ways: either as a cultural form or as a cultural practice. As far as the cultural form is concerned, she understands the “cultures of Internet” as the study of the specific cultural forms based on the Internet, the paradigmatic example of which can be the development of netiquette, emoticons, and specific online norms and values. In other words, Internet cultures are cultural forms that emerge on the Internet like virtual worlds players, webcam girls, hackers, bloggers, and other collectives whose senses of self, belonging, and group socialization are shaped significantly by digital media. As a cultural practice, Hine suggests that, as happens with other creations, the Internet may be analyzed as a “cultural artifact.” This implies the study of practices which are not necessarily specific of the Internet but acquire different dimensions online, for example, the making of videos for YouTube or sharing photos on Internet services like Flickr or Instagram.

Focusing specifically on the relationship between the ethnographic method and Internet studies, we distinguish three different approaches, which can be defined as follows: virtual ethnography or ethnographies of cyberspace, connective or online/offline ethnographies, and ethnographies of Internet in everyday life. These methodological approaches have evolved in parallel to the different Internet development periods. The first starts from the Internet’s beginnings to the late 1990s, the second coincides with the expansion of the World Wide Web, and the third corresponds to the development of the so-called social media or social network sites, from approximately 2005 until the present day. However, if there is a close relationship between technological stages, users’ appropriations, and the elaboration of different ethnographic strategies, the fact is that, even today, these three ethnographic approaches coexist in several and remixed ways.

Virtual Ethnography

The first empirical studies applying ethnographic fieldwork to the Internet were conducted by scholars from different backgrounds mostly from communication and media studies and were based on triggering off metaphors that led to a conceptualization of the Internet as a new kind of social space. This “cyberspace” was conceptualized as an immaterial place where disembodied selves could freely interplay, forming “virtual communities,” and where new social and cultural patterns flour-

ished and gave birth to a brand new “cyberculture” (Jones, 1997; Porter, 1996; Shields, 1996).

The notion of cyberspace, taken from the novelist William Gibson who defined it as “a consensual hallucination experienced daily by billions of legitimate operators” and as a “graphical representation of data abstracted from banks of every computer in the human system of an unimaginable complexity arranged in the non-space of the mind” (Gibson, 1984, p. 30), was used by activists such as John Perry Barlow and academics like Michael Benedikt to refer to the social space made possible by the Internet. In the popular as well as in the sociological imagination, cyberspace or “virtual space” almost became synonymous with the Internet itself (Gómez-Cruz, 2007).

Furthermore, at this early stage, the role given to technology to transform culture and society was highly important. Thus, the first social studies of the Internet considered that the properties of the medium such as virtuality, spatiality, disintegration, and disembodiment were shaping new modes of social activity (Slater, 2002). For example, considering that, at this time, computer-mediated interaction was mainly textual, anonymity was taken as an intrinsic characteristic of the medium. This is illustrated by Peter Steiner’s famous cartoon, in which two dogs are sitting in front of a computer and one says to the other: “On the Internet, nobody knows you’re a dog.”

Along the same line, in 1994 Howard Rheingold inspired another powerful metaphor: virtual community. Based on his own experience of participating in the electronic bulletin board system (BBS) known as The WELL, he argued that long-term participation in these electronic forums creates a shared system of beliefs, values and norms, and specific behaviors. These enact a collective sense of belonging and create a new kind of community, based solely on common interests, goodwill, and solidarity. Sherry Turkle (1997) coined a third compelling image: virtual identity. In *Life on the Screen*, and drawing on her research with multi-user domain (MUD) users, she explained how people could perform different and alternative online identities. The goal, then, was to establish whether computer-mediated interaction was changing our own understandings of self and self-identity, and to what extent virtual identities were free from the social and cultural constraints of “real life.”

If the connection to the Internet was like “entering into cyberspace” and one could create alternative online identities, whose socialization shaped virtual communities, it was tempting to study these communities as though conducting exploratory research of a “primitive culture,” as in the early days of anthropology. First, ethnography was considered the proper method for describing an unexplored territory (as the non-Western cultures were for early Western anthropologists), and, second, computer-mediated interaction seemed to give rise to new genres of discourse that could be described ethnographically (Herring, 1996; Mayans, 2002). Therefore, the Internet was conceptualized as giving birth to an entirely new culture that was going to transform our culture at large: the new world of Cyberia (Escobar, 1994). Meanwhile its population was studied as the “natives of the Internet Islands”

(Bakardjieva, 2005), following Malinowski's canonical work on the Trobriand Islanders.

Despite the fact that in anthropological studies the idea of fieldwork in a community bound to a single territory had long been questioned (see Gupta & Ferguson, 1997; Hannerz, 2003; Marcus, 1995), these conceptualizations led to the development of a large corpus of ethnographic fieldwork on Usenet, BBS, chatrooms, electronic forums, and so on, mainly focusing on social and cultural dynamics (Markham, 1998; Reid, 1994). The ethnographic gaze was focused on how individuals come together via computer-mediated interaction and developed common rules, collective norms and values, as well as a sense of belonging (Jones & Kucker, 2001, p. 217). Among these early ethnographic studies, most were related to communication studies and audience reception research, such as online fan communities of soap operas (Baym, 2000) and television series or films (Jenkins, 1992), showing how audiences were constructing meaningful online communities by taking mass media popular culture as their referent.

The idea that prevailed was that the nature of those online communities was metaphysical and, therefore, it was sufficient to study them merely by analyzing the "life on the screen." This was translated into a limitation of the field site to a single online community and into studying only online interactions. Scholars made aprioristic assumptions about time, space, and the differentiated nature of online culture, online identity, and online social ties. Virtual ethnographies were largely based on the *a priori* attribution of properties of the Web by establishing a contrasting comparison with the physical world and face-to-face relationships. Cyberspace worked as a unifying ethnographic field site to describe all kinds of social life occurring on the Internet, aligning different artifacts, uses, and practices. The metaphor of cyberspace has also contributed to the idea of the Internet as a unified object of study with inherent characteristics and properties (Ardévol & Estalella, 2012).

Throughout the 1990s and despite these conceptual constraints, the detailed descriptions of many different "virtual communities" demonstrated that computer-mediated interactions were culturally rich and that users engaged in a fully meaningful social life. Those studies were a first step to legitimize the ethnographic study of online social relationships, given that some earlier conceptions considered computer-mediated communication to be "less real," socially weak, or second-class communication, unable to create sustainable social bonds and culturally significant worlds (Walther & Burgoon, 1992).

The ethnography of virtual worlds is another approach that is currently growing (Boellstorff, George, Nardi, Pearce, & Taylor, 2012). Ethnographers propose that online participant observation is an epistemological and methodological response to the challenges of "virtual worlds" or meta-verses, especially in online game cultures (Pearce, 2009). So, more recently, we found exclusively online ethnographies that justify their methodological strategy by pointing to the delimitation of their object of study to the particular "virtual cultures" that emerge from online interaction. For example, Corneliussen and Rettberg (2008, p. 1) clarify this position with the use of

a metaphor: “Being new to the culture of the *World of Warcraft* may be compared to being an immigrant in a foreign culture.” The problem is focused on studying the process of socialization that takes place through online participation. In this sense, other authors propose that virtual worlds can be studied as examples of “subcultures” (Gelder, 2007). Boellstorff, for example, when studying *Second Life*, argues that the distinction between virtual and real is not an assumption of the ethnographer but something that has to be explained through fieldwork. He explains that this division is a consequence of a performative act of the players to set apart their “virtual world” from the “actual world” by the “worlding” of different cultural domains (Boellstorff, 2008, p. 18).

Connective Ethnography

The second ethnographic approach to the study of digital technologies, especially the Internet, could be called connective ethnographies. Although the concept of *Virtual Ethnography* coined by Christine Hine was a hallmark for the ethnographic study of the Internet, another book also opened a different understanding of ethnographic fieldwork: *The Internet: An Ethnographic Approach*, by Daniel Miller and Don Slater. Both of these texts were published in 2000. These researchers, with a background in material culture, media political economy, and social studies of science, abandon the idea of cyberspace in favor of a situated study of the Internet. Hine contextualizes Internet use in media practices, following the controversial case in 1998 of the British nanny accused of murdering the North American baby she was taking care of, while Miller and Slater locate it in the particular context of the cultural practices of the people of Trinidad Island. Both blur the divide between online and offline fieldwork. Instead of studying Internet cultures as separated and independent features from the real world, these authors begin to speak in terms of online/offline as a form of recognition of the multiple connections and the close relationship between these two social grounds.

Christine Hine herself was one of the first to reflexively apply the ethnographic paradigm of the constructed nature of the field in anthropology (Marcus, 1998) within Internet studies, systematizing her “principles for virtual ethnography” from a multisited and connective notion of ethnography (Hine, 2000). Hine approaches virtual ethnography through participant observation of different web pages, as well as their links with the mass media system, breaking with the idea of community and place as central for the definition of the ethnographic field site, understanding field site as the empirical locale where research is conducted.

At the same time, during the early years of the twenty-first century, Internet demography and usage was also changing, with a significant growth in the participation of various groups and communities in the network and the integration of the Internet into everyday mundane activities (Wellman & Haythornthwaite, 2002). As in the case of the monographs mentioned above, other scholars began to do

fieldwork “inside” and also “outside” the screen, exploring the relationships between online and offline interactions. As Bakardjieva noted: the “Internet is exactly the place where the online and offline meet. Its study should mean keeping the vision on both sides at the same time, especially because very occasionally Internet is only a bridge between one offline and another” (2008, p. 54). Thus, the divide between online and offline fieldwork progressively blurs. Instead of studying Internet cultures as separated and independent features from the real world, these authors began to speak in terms of online/offline as a form of recognition of the multiple connections and the close relationship between these two social grounds.

Authors like Leander and McKim (2003) and later Hine (2007) developed the concept of “connective ethnography” to address the issue of integrating research across online and offline situations. Fields and Kafai (2008) also adopted the notion of connective ethnography to focus on how gaming expertise spreads across a network of youths at an after-school club where they simultaneously participate in a multiplayer virtual environment, using online and offline participant observation, interviews, video recordings, and collecting online and offline social interaction data. For Jenna Burrell (2009), the notion of the ethnographic field linked to a place-focused concept of culture needs to be reformulated when studying social uses of the Internet. Connective ethnography is not only a question of mixing methods and combining online and offline strategies, but also of constructing the field site as a heterogeneous network mapped out from the social relationships of the subjects and their connections to material and digital objects and to physical or virtual locations. As Hastrup and Olwig have argued for contemporary ethnography at large, instead of viewing the ethnographic field as a “site” it is better to understand it as a set of relations, focusing on the connections between multiple locations where actors engage in activity. Thus, “ethnography in this strategy becomes as much a process of following connections as it is a period of inhabitation” (Hastrup & Olwig, 1997, p. 8). Translating these notions of an anthropology of the contemporary, Postill (2008) notes that taking the Internet as a field for ethnographic research does not imply using the notions of community or social networks but to understand that there are different forms of mediated sociality.

Internet in Everyday Practices and Media Ethnography

Nowadays, the Internet has become so widespread and complex that attempting to describe a single platform ethnographically, even a massive one such as Facebook, would be to dismiss the multiple interrelationships and overlapping uses of digital technologies. The technological landscape has evolved and is no longer just about computers, Internet, and platforms. Wireless networks, mobile phone apps, video game consoles, and so on are all interconnected and we can say that our communicative ecosystem has been almost entirely digitalized. Concurrent use of multiple media has become a regular feature of everyday life and, quoting Mark Deuze (2011,

p. 137): “media have become so inseparable from us that we no longer live with media, but in media.”

This third understanding of the Internet as media is enriched by a twofold perspective: that of the social shaping of technology as an approach to technological design (Bijker & Law, 1994) and the domestication theory in media studies. Both highlight users’ agency in the innovation process and how technology is creatively appropriated by users (Haddon, 2005; Silverstone, Hirsh, & Morley, 2003). The move to ethnography occurred in media studies when researchers began to observe the media experience in everyday contexts (Schlecker & Hirsch, 2001), seeking alternatives to traditional social science research on media effects. Thus, media ethnography and Internet ethnographies converge in situating the focus in everyday practices.

Today, the Internet, associated with other informational technologies, represents a potential challenge (and complement) to mass media and entertainment industries. From a cultural studies approach, digital technologies are commodities that have symbolic value in the “circuit of culture” (Du Gay, Hall, Janes, Mackay, & Negus, 1997). In addition, this new media landscape forms new means of production, circulation, and consumption of media products that intertwine with significant practices of representation and reproduction of social identities. In this sense, the use of digital technologies is part of a process of appropriation, which develops as people incorporate these technologies in everyday life.

Several authors have explored the relationship between audiences and cultural production in new media (Harries, 2002; Jenkins, 2004; Marshall, 2002, 2004). Although they define this relationship in different terms, they agree on the rise of a productive audience and the blurring between the spheres of production, distribution, and consumption. For Nick Couldry (2004), theorizing media as practice implies a change of paradigm in media studies. It changes the focus of media research from semiotic analysis of text content to the people’s doings and sayings. Then, media practices is defined as the open set of practices relating to, or oriented around, media. One consequence of this is to anchor media theory in ethnographic knowledge, overcoming “media-centrism” to study cultural production. As Elizabeth Bird (2010) points out, one of the main problems of studying media in relation to cultural production has been that audience research has traditionally been based on the concept of “audience response” to specific media. So, in *The Audience in Everyday Life*, she argues that we need to

move “beyond the audience” as a theoretically definable construct, but we should not be abandoning the goal of understanding real people, living real lives in which media play an ever-increasing, if certainly problematic, role . . . Only ethnography can begin to answer questions about what people really do with media. (Bird, 2003, p. 191)

These authors put forward the potential for setting the analysis of media production and consumption within ethnography, as a methodological tool for understanding people’s motivations and engagements with media. Moreover, media ethnography

involves studying media practices beyond the parameters set down by theoretical assumptions of cultural production, based on the circulation of media products. Media practices may be understood as a wider set of practices most of them with, around, and through digital technologies relating to creative processes carried out by individuals, collectives, governments, transnational corporations, and other social agents with different goals and purposes. Coleman observes that the aim of media ethnography is, then, to explore “the complex relationships between the local practices and global implications of digital media, their materiality and politics, and their banal, as well as profound, presence in cultural life and modes of communication” (Coleman, 2010, p. 487).

Summing up, this analysis of the relationship between ethnography and the different fields and objects related to Internet and media research attempted to show the complex relationship between a work’s theoretical framework, its object of study, and its empirical reference. On the one hand, we have pointed out the importance of theoretical concepts and epistemic approaches to shape the ethnographic field and frame our object of study. On the other hand, we have highlighted the development of a methodological inquiry about what it means to do fieldwork through and with digital technologies, and how to deal with technologically mediated practices. Therefore, we propose to talk about digital ethnography as a way to engage with the central role of digital technologies in everyday life, and also to understand the importance of field construction, reflexivity, and the development of tools as key elements of the ethnographic endeavor (not limited to digital objects). Next, we will see how the Internet has been conceptualized as a research tool and as a field for conducting ethnographic research, giving an overview of the different challenges an ethnographer faces when studying mediated digital interactions.

Carrying Out Digital Fieldwork

Annette Markham (2004) argues that methodically the Internet has been understood both as a field site and as a research tool. The first concept highlights the way in which the Internet and its different platforms and technologies have become the context of participant observation that is, the field site or the locus of the social interaction between the ethnographer and his or her respondents. The second puts the emphasis on the Internet as a means for data collection. Several authors have explored the Internet’s possibilities as a research tool (Dicks, Mason, Coffey, & Atkinson, 2005; Fielding, Lee, & Blank, 2008; Mann & Stewart, 2000; O’Connor & Madge, 2003) with which to conduct surveys, interviews, network analysis, and focus groups as well as to present research results (Dicks, Soyinka, & Coffey, 2006; Hewson, Yule, Laurent, & Vogel, 2003).

However, from an ethnographic standpoint, the question is how to integrate data gathering into a wider perspective of fieldwork. Ethnographic research does not

make a clear-cut distinction between data gathering and “being in the field.” Although plain observation, interviewing, and other ways of collecting materials (e.g., questionnaires, etc.) are part of ethnographic fieldwork, what characterizes the method is the participatory approach: the social presence of the ethnographer “in the field.” In ethnographic fieldwork, first we weave relationships and afterwards we collect data. Fieldwork, its continuity and its results, depend largely on the relationships we build during the whole process of investigation. Ethnography is a *slow science* methodology, as ethnographic fieldwork ideally must take at least one year in order to develop a glimpse of the different rhythms and moments that punctuate our social life.

Here we will take into consideration how we manage our relationships and conduct research in digital settings. While some authors argue that “virtual” worlds are a different kind of social space than those created by face-to-face communication, we will suggest that the nature of the social space does not depend on the characteristics of the medium, but on the kind of social interactions that people are engaged in.

Constructing the Field

As we have seen, carrying out fieldwork in ethnographic research involves tracing personal relations in different social contexts. Delimiting the field is not only a question of finding a place or a community within which to conduct research, but also of constructing our field site according to our research questions and objectives. As Vered Amit (2001, p. 6) clearly puts it:

The ethnographic field cannot simply exist, awaiting discovery. It has to be laboriously constructed, prised apart from all the other possibilities of contextualization to which its constituent relationships and connections could also be referred . . . the construction of an ethnographic field involves efforts to accommodate and interweave sets of relationships and engagements developed in one context with those arising in another.

Digital fieldwork requires adjustments in how ethnographers define the empirical site of their research: Where should participant observation be conducted? How is access to settings and research subjects to be obtained? What ethical dilemmas do these decisions involve? Rather than deciding in advance to conduct ethnographic research on a virtual community or in a specific social media, the ethnographer should choose the topic of interest, and then define the field and how that topic involves different modes of communication, people, things, and locations. For instance, one could begin fieldwork by attending a rock festival and end up participating in chatrooms, visiting the blogs of musicians’ fans, and sharing files with them through instant messaging on mobile phones. As the Internet forms part of the daily

life of many of the collectives we study, and as they do not necessarily make a distinction between their online, offline, and indeed phone relationships, we follow our subjects across different ethnographic contexts and settings.

Digital ethnography does not establish fixed dichotomies between online and offline realms. There are no substantive differences between online and offline ethnographies but rather different kinds of environments and ways of social co-presence. Digital ethnographers may conduct participant observation and interviews through an array of digital technology devices and therefore must develop the technological, social, and cultural competencies necessary to fully participate in these sociotechnical contexts. As image, sound, and movement are becoming more and more common features of social interaction, not only for web design and online communication, but also for instant messaging on mobile phones and GPS monitoring systems, the digital ethnographer has to move between different research contexts and methods. With this development, the division between online and offline ethnographies tends to collapse even more and digital ethnography must be conveyed as a mediated practice, as a remix of methods that has to be engaged with the researcher's experience. This means a technologically enhanced but always embodied ethnographic practice.

Conducting Digital Fieldwork

Digital ethnographers use digital media to generate data in two ways: first, they use digital visual and sound recorders, notebooks, or PCs to write their field notes and, usually, the same devices to collect textual data, visual material, and sound and movement created by the subjects of study (Garcia, Standlee, & Bechhoff, 2009, p. 64). Moreover, the interaction of the ethnographer with the participants of the research also takes place in digital environments, and the whole interaction can be recorded and preserved.

By conducting participant observation, the ethnographer accomplishes three main methodological goals: to gain presence in a concrete social space, to define her or his identity as a researcher in the field site, and to let respondents know about the research interests in order to obtain informed consent (in the ethnographic method, this consent used to be tacit and not necessarily expressed through formularies). The last, but not least, important factor is to have first-hand experience of a particular technology, as any other participant would. Our experience of conducting digital ethnographic research suggests that participation observation depends largely on our skills in managing textual, visual, sensory, and kinetic components when interacting with research participants. Furthermore, the process of observation itself involves dealing with textual and visual information displayed on the screen, such as the use of emoticons, pictures, colors, page layout, and graphic designs, as key elements of the digital interaction, as well as the interactive capabilities of the technological scripts.

Gómez-Cruz's ethnographic fieldwork on digital photography is presented as an empirical example of the former discussion. The author's fieldwork was conducted between September 2008 and March 2010 and was focused on digital photographic practices based on the photo-sharing platform Flickr. After a few months of observant participation on the site, uploading photos, commenting, and participating in different groups, he found a group of amateur photographers called SortidazZ. This group, geographically based in Barcelona, was very active and organized many physical encounters and photo walks (gatherings to take pictures in a chosen area). When confident enough, he decided to send his first public message to the group introducing himself and explaining the research he was trying to carry out:

Let me introduce myself. I'm Edgar Gomez, a Mexican based in Barcelona and currently writing my doctoral thesis on digital photography practices (an ethnography from a sociological and anthropological point of view). I told Carles (KaosBeast) my interest in joining the group and he politely told me to publicly launch. I am a novice in photography and this is a hobby I enjoy. However, my interest in the group is twofold as I'd like to share my concerns, questions and fieldwork. Finally, you are the experts and the idea is to learn from you, with you. Well, you will say what you think, for now, if you please, I'm in for the next photowalk.

regards
Edgar

The group welcomed him with jokes ("are we so weird that somebody wants to study us?") and warm convivial messages. Soon, it was clear that the group's communication was not reduced to Flickr but was actively open and experimenting with different social media, apart from gathering together for photographic sessions or simply hanging out together. Members of SortidazZ tend to shoot; process; show each other photos, videos, and web pages; make comments on any platform while they are with other members; use WhatsApp (a mobile chat application) as a group's backchannel, and so on. All of this could easily happen while members of the group were drinking beers together on some Barcelona terrace. Therefore, the ethnographer decided to follow and trace those connections, which took him to Facebook, Twitter, Gmail, SMS, phone calls, Skype, as well as to some photographic walks and personal encounters. Through these trajectories, activities and "sites," the field was instantiated in different locations and devices.

At the same time, Gómez-Cruz's profiles in all the social media sites had a permanent link to his blog where, during the fieldwork, he wrote several reflections on photography, his life as a PhD student, and his daily experiences of the research process. The blog was but one of many devices to develop a constant "presence in the field." Although, at the beginning, the blog was only intended to be a "public face" for his work and not understood as a research tool, to his surprise, group members began to leave comments on the posts, send him links, or comment on the content of the blog in the blog itself and in other electronic forums. The

ethnographer was not only actively creating the field, but also weaving himself into it. Along with Flickr, Facebook, and Twitter accounts, the ethnographer's blog served as a form of personal exposure: a way of performing his identity as a researcher while becoming an active "practitioner" of digital photography.

In this long-term ethnographic study of digital photographic practices of a heavy-use Flickr group, Gómez-Cruz observes that the photographic object itself is changing from a memory device to a connective practice, and from having a primary social cohesion role to becoming a key element in new groups' formations in daily life. Helping, further on, to understand digital photography as an assemblage of several practices (shooting but also processing, sharing, and exhibiting). These production practices are more and more related to digital mediated socialization, especially since photography is embedded in mobile phones, social networks, and sharing sites.

While participant observation allows the ethnographer to get to know the collective life, norms, values, and dynamics of a group, the in-depth interview is a gateway to the perceptions and meanings that respondents attach to their actions. At the same time, the interview is a unique setting that gives the research participants an opportunity to reflect aloud on their own practices and express their thoughts, emotions, and feelings related to their experiences. Moreover, ethnographic interviews are useful for contrasting the feelings, impressions, and conjectures raised by the researcher during immersion in the field. It is obvious that during fieldwork there are many occasions for engaging in conversations with our respondents about the ambiguities of social life and that these are a valuable source of understandings. Although some conversations naturally occur, while others are directly addressed by the ethnographer or the social actor, in-depth interviews undoubtedly constitute a different social context than conversations.

In-depth interviews are explicitly set up by the ethnographer and are typically open-ended and more flexible than structured or semi-structured interviews while being more focused than natural conversations. The nature of the questions depends, again, on the research topic and the kind of contextualization that the ethnographer needs for interpreting data, but it is useful to have some kind of script that helps conduct the interview. As happens with online conversations, online interviews can be conducted through different Internet technologies, from chat or instant text messaging systems, electronic forums and email, to voice and video conferencing webcam devices. Some authors argue that the characteristics of the sociotechnical context or medium impose communicative restraints, while others argue that they open new research possibilities. For example, textual interviews (and especially those based on anonymity) are considered useful for approaching sensitive or elusive topics, since they tend to allow people to express themselves more freely (Illingworth, 2001; Orgad, 2005; Sanders, 2005). Although this will pose problems of authenticity and spontaneity, textual interviewing allows respondents to put more thought into their responses. The anonymity factor may also balance the power relationship between interviewer and interviewee because the latter may feel freer to challenge researchers online than in a face-to-face interview. In general, online methods allow the inter-

viewee to gain control of the course of the interview but, ultimately, his or her commitment will depend on personal motivation and engagement with the research. Nevertheless, anonymity may be overestimated, since an ethnographer usually knows the person before the interview and has previously established a rapport. Besides, it is not imperative to acknowledge the “real” name of the person when studying online interactions and patterns.

In Gómez-Cruz’s work, some online interviews using instant messaging systems and Skype proved to be very useful as a way to establish a complex chronology because informants “showed” examples by copying and pasting the specific URL of the photo they were referring to, not only from their own streams but also from other people’s photos, blogs, or web pages. At the same time, while dealing with the issue of self-portraits, specifically women’s nude or erotic self-portraits, the respondents were more comfortable talking about their experience online with a sense of trust in the interviewer and, at the same time, with the feeling of being protected by their own private space. Interestingly enough, this is exactly the way these individuals produce photos in their private/intimate space to then upload to the “public” space of social networks. One of them even preferred to create a diary of her thoughts about her practice than to be interviewed. Here is a pair of short examples of the different narrative styles about online self-portraits that arose in the research:

[Chat interview fragment]

JESSICA: For me public photos are those on the web and private are not?? Hehehehe
No, this is not true;) There are private public photos, but do not know if
the right word is private = S

[Email interview fragment]

EMMA: Pictures of Emma [her own pictures uploaded] are to me almost like the
images of a character (but do not think I have problems with multiple
personalities). In any case, the nudes are of her . . . It’s not the same to see
the image of a woman to see her in person. Even many people who know
me personally cannot believe that I’m the one shown in these pictures.

While in chat interviews, the ethnographer must deal often with emoticons, short and nongrammatical sentences, email interview answers more closely resemble the epistolary genre. These different narratives bring up the fact that, in the social sciences, the instruments with which we investigate are always part of the context of research and shape the textures of our data, but this does not necessarily mean that online interviews are better or worse than face-to-face ones for ethnographic analysis. Furthermore, online interviews may generate new interview genres, since it can take the form of an epistolary genre, as shown in email interviews, or it can enter the online universe of the respondent, as in the case of an interview conducted in a virtual world or the interchange of hyperlinks during an instant messaging chat interview. The flexibility of online techniques allowed the ethnographer to gather important data that could probably not have been gathered any other way.

Digital Data Analysis and the Ethnographic Description

Field notes and field diaries are essential to ethnographic research. Traditional field notes, tables, and drawings are handwritten, and some online ethnographers still employ this method in addition to the multiple forms of capturing and registering information as audio and video records, printouts, screen captures, navigation videos or social bookmarking, and the visualizing social network software available to us today. Some ethnographers also use wikis and blogs as their fieldwork diaries. Online field notes or logs, however, should not be confused with the web pages, blogs, wikis, or social media profiles that ethnographers create to present themselves and to share their research with participants and respondents. These online sites are usually open to a general audience while field notes are kept private.

Field notes help researchers catalogue, describe, and develop theories from their observations, as well as record their emotional reactions and impressions. For example, in his ethnographic study, Gómez-Cruz's field notes were handwritten in a fieldwork diary while, at the same time, he used his smartphone to take notes and photos on (and of) the field. The smartphone was, at once, a field data gathering tool and a constant connective device with the group members. Another example of new ways to carry field notes was the use of "annotated screenshots," which became very helpful as "images of connections" to be used in the interviews about specific topics discussed, as a sort of photo elicitation technique. For example, Gómez-Cruz used his own self-portrait photography in order to create a threat in his fieldwork Flickr site. The answers he got included accounts about self-portraits, but also several photographs taken and commented upon by the respondents.

At the end, the results of the ethnographic fieldwork are an array of very different kinds of data, from field notes to visual, aural, and textual data or transcribed interviews. To analyze them, we must consider our theoretical assumptions as well as the broader context in which the data has been extracted and objectified. Qualitative data software analysis may help us in that process, using programs such as ATLAS.ti or NVivo. This software is useful for archiving, coding, hyperlinking, sharing, and representing visual and other digital ethnographic material but it does not replace analysis and ethnographic description (Pink, 2007, p. 139). Thus, the ethnographer becomes a reflective and heuristic figure who bridges the gap between the reliance on ethnographic techniques (participant observation, in-depth interviews), field experience (immersion, building of trust, bodily engagement), and analytical tools (software for textual and visual analysis, analytical categories).

It is imperative that we distinguish the analytical categories of our theoretical framework from those that come directly from the field, that is, between *etic* and *emic* terms, categories, and conceptualizations. For the sake of clarity we say that the role of ethnographers is to meaningfully explain the studied universe, taking into account the vernacular categories of their research subjects (*emic*) and developing theoretical frameworks that help to organize them (*etic*), so that they can bring some

light to their research questions. It means to displace the researcher from her or his own vernacular categories, even when these may be largely shared with their correspondents in the field. As Coleman explains, “the fact that digital media culturally matters is undeniable but showing how, where, and why it matters is necessary to push against peculiarly narrow presumptions about the universality of digital experience” (2010, p. 488).

Ethical Dilemmas

Finally, the outlet of an ethnographic process is usually a *monograph*, a theoretically oriented description of the object of study we have constructed while following our subjects’ practices in different field contexts. Thus, ethnographers must make decisions about how to present research findings to their respondents, taking into account online audiences (Bakardjieva & Feenberg, 2001). This raises ethical issues regarding the fact that, in most digital ethnographies, the field is constructed and maintained through online interaction that is open to general view. Maintaining privacy and anonymity on the Internet is not only difficult but may come into conflict with the ethnographic task. This was the case with Gómez-Cruz’s ethnography of digital photography practices, which was mostly carried out through social media platforms. He contacted the group under study via their site profile, and the process of gaining acceptance by the group could be followed by any outsider, as well as all the fieldwork interactions that took place in his profile and in his field blog. This being the case, the ethical requirements of informed consent might be clearly exposed but respondents were very aware that full anonymity could not be guaranteed.

Digital ethnographers are troubled by the same worries about self-exposure and privacy as their research subjects. A website or a blog may be regarded as a public space, as it is publicly accessible, yet interactions that occur within that social space may be perceived by the participants to be mainly private. Therefore, Internet ethnographers would be well advised to consider their initial self-presentations to their research subjects carefully and to be aware of the fact that some of their online interactions are permanently and publicly exposed. The digital ethnographer should negotiate the level of anonymity that participants wish to maintain when data are fully elaborated and results presented in different formats. Not all the interactions with the participants during fieldwork have been carried out in public social spaces, and the ethnographer must preserve participants’ confidentiality by changing names, nicknames, and other traceable footprints when it is required.

We propose, along with other authors such as Forte (2004), to think of digital ethnographic ethics from the point of view of reciprocal and mutual collaboration. The co-production of the field is an activity that can also afford ethical values, such as sharing knowledge and experience with our respondents. Ethnographers use different terms such as “informants,” “participants,” “co-participants,” or even “co-researchers” in contrast to quantitative research, which traditionally uses the

term “subject” to refer to the people who participate in their research. These different terms tell us something about the relationship between researchers and researched as they describe the kind of involvement that the ethnographer expects from the research subjects. What is important to note is that, in any case, the people who participate in the ethnographic research not only are familiar with the ethnographer but also contribute to the configuration of the object of study and to the ethnographer’s knowledge of the empirical situations. They are more than passive subjects of study, but active respondents and, somehow, co-participants of the research process with the ethnographer.

This collaborative aim must be transferred to the ethical concerns when writing the ethnographic results or monograph. Digital technologies are well designed for sharing information at distance and make it easy to let participants know about the final product. As we have seen, Edgar Gómez-Cruz shared his own findings along the way through his blog and profile in Flickr and later he allowed participants to comment on the chapters of the monograph related to the group’s experience. This practice is not exempt from conflict, as people may not agree with the results. The researcher has to ensure that the participant’s opinions are treated with respect and the *emic* interpretations accepted, but the *etic* part of the analysis depends entirely on the ethnographer. Whatever the level of involvement of the participants in the research might be, ultimately it is the ethnographer who controls the process of interpretation, the theoretical framework, and the accountability of the final product.

Some Final Remarks

To conclude, ethnography, as access to knowledge of the intersubjective experiences and contexts of interaction, brings a new perspective to the empirical study of media. It goes beyond the qualitative and quantitative audience studies focused on hermeneutic or semiotic interpretation of the media text and political economy. On the one hand, from a critical perspective, the close study of media experience allows us to analyze the local effects of an unequal allocation of resources and rights and the processes of moral valuation (Lindlof & Shatzer, 1998, pp. 172–173). On the other hand, ethnographic studies of digital media particularize the role that digital media play in the different spheres of social activity and among a great variety of collectives, from teenagers to political activists, and from audiences to media industries and government bodies. Indeed, digital media ethnographies are central to the reformulation of studies in journalism, democratic free expression practices, and current debates about market and commons models of property. Ethnographic accounts complement other kinds of studies, not only by representing people’s hopes, desires, and expectations, but also by pointing to asymmetrical relationships, opposite values, and challenging visions of futures.

Digital ethnography is ethnography by other means, and the question is to what extent these other means transform ethnographic practice. We must ask, with Sarah Pink (2012, p. 12), how “the developments in digital, mobile and locative media challenge us to rethink the ways in which media(ted) research and the ethnographic encounter is understood.” On the one hand, as we have demonstrated, the digital ethnographer needs to be co-present in the field using the same technological devices as the participants in his or her study. On the other hand, digital ethnography incorporates new technologies of recording, analyzing, sharing, and presenting data and results along with new ethical challenges. Last but not least, digital ethnography refers to the emergence of new topics of research for example, virtual worlds and to the transformation of our objects of study. The field of media studies as a whole has to come to terms with how digital media is articulated with everyday practices and with the new dimensions of our notions of sensoriality, spatiality, and temporality.

Methodology is also about how we create knowledge, and technological shifts have implications not only for the way in which we experience and research media, social relations, and cultural formations, but also for how they are theorized (Lapenta, 2012, p. 131). Sarah Pink (2012, p. 13) addresses this point when she notes that “our experiences of new technologies are . . . encouraging us to think in new ways theoretically which in turn reflect back on how we theorize old media and on how we engage with media as researchers.” Digital methodologies may be fueled by old understandings but, at the same time, they might take us to different ways of knowing and to different types of knowledge.

Methods and Strategies for Measuring the Effects of Similar Virtual and Physical Activity

Lillian C. Spina-Caza

ABSTRACT

The study of virtual play activity as it unfolds on the Internet, in video games, and with mobile technology use, is still in its nascent stages and is in and of itself experimental by nature. Thus, it is important that researchers begin to think about, question, and test new research methods – or extend traditional methods – for the purposes of understanding the effects new media are likely to have on human development. This chapter discusses two early observation studies of Internet and video game play that inspired a third, multimethod field experiment aimed at contributing a theoretical model for exploring the effects of moving activity from physical to virtual environments. All three provide strategies and methods for how the study of new media technology might benefit from a more elaborate research design.

Research on young people and interactive virtual technology (IVT)¹ use is abundant and diverse, emerging from numerous fields of interest. These fields include cognitive science, human–computer interaction (HCI) and its subfield of child–computer interaction (CCI), video game studies, developmental and ecological psychology, and literacy, communication, and media studies – to name just a few. from those suggesting that new technology environments can enhance creativity, promote media literacy and information technology (IT) proficiency, and empower young people to be programmers in their own right, to those more circumspect about moving activity to virtual environments and the impact of losing touch with the physical world (Healy, 1998).

One common thread running throughout much of the literature is the call for young people to be *creators* and not just consumers of computer culture, *producers* and not just participants in the virtual worlds they inhabit. It is a call that places the notion of *creative agency* front and center in explorations of IVT use. What sorts of creative or contributive activities young people can undertake, and what they perceive they are able to accomplish when playing video games, interacting with online content, or using mobile applications, are critical to understanding the effects of virtual activity on a developing person. Knowing more about how young people perceive themselves and their own creative abilities when interacting with virtual environments can also inform and improve the design of interactive technologies overall.

Another recurring thread in the research and literature on IVT use is the call for empirical research to address the benefits of moving activity from physical to virtual settings. Across disciplines there is agreement that studies examining the effects of virtual interactions are long overdue. Roussou, Oliver, and Slater (2008), for example, who use activity theory to evaluate behavior in virtual environments, note that “To date, very few efforts exist that explore the value of interactive virtual environments and applications, especially the added value that these can bring to children’s learning” (p. 141). Livingstone (2006), who conducts large-scale, multinational, surveys of children and Internet use, writes, “little work has examined, let alone demonstrated unequivocally, the positive benefits this has for educational achievement” (p. 220).

The research methods and strategies presented in the studies that follow address both of these threads, and are also influenced by activity theory (AT), which has its roots in developmental psychology and education. AT emphasizes the connections between human consciousness, activity, and environment, and recognizes the role human agency and creativity play in a person’s ability to realize goals and intentions. According to Nardi (1996), who researches activity theory in the context of HCI and interaction design, AT views human beings as “active beings in control of their tools for creative purposes rather than as automatons whose operations are to be automated away, or nodes whose rights to privacy and dignity are not guaranteed” (p. 87).

While AT provides a solid framework for research concerned with youth and technology use, it has some limitations. For example, by focusing on collective activity oriented toward motives and objects, AT does not examine subjective experience or how self-perceptions might be changed in the performance of certain types of activity, in this instance creative activity. It also does not tell us whether there might be a relationship between *mode* or *how* an activity is performed – with physical or

virtual objects and artifacts – and the effects on a person’s perceptions of his or her own creative agency.

Kaptelinin (1996), whose work also examines activity theory and interaction design, observes that “Virtual realities present a problem to activity that probably cannot be solved without enriching activity theory’s basic principles with new ideas” (p. 64). Tikhomirov (1999), who notes human creativity has been dramatically altered in the context of computer use, points out that “The content of individual human experience includes not only mastered social experience, but also personal experience, the experience of an activity’s realization” (p. 358). As he concludes, “Studies of creative activity demand an analysis of the relations between activity and personality in a specific creative act” (p. 350).

The research approaches discussed in this chapter presuppose the importance of activity theory to our understanding of IVT research and design. The three studies presented here were conducted to broaden our knowledge of virtual activity by employing various qualitative and quantitative analyses to describe what happens during Internet and video game play, and what the effects might be on a developing person. Some of the research strategies used included the coding of visual data analysis as children played at two popular websites; observational and cooperative inquiry techniques were used to explore similar physical and virtual play activity with a group of students in an after-school program; and an experimental field study that included physical and virtual conditions and pre- and post-test surveys was conducted to examine the effects of similar physical and virtual activities on young people’s perceptions of their own creative agency.

The chapter also introduces the creative agency model (CAM), which offers a way to operationalize or measure self-perceptions that emerge in the performance of activity in virtual environments. CAM suggests we adopt a *bioecological* approach to the study of virtual activity and affordance use to better understand how this activity might influence human development over time. It supports iterative, multimethod designs that employ observation, interpretation, and experimentation to examine the role environmental artifacts and objects play in goal attainment, as well as the subjective experience and possible changes to concepts of self that emerge in the performance of virtual activity. No other studies that we are aware of bring together activity, affordances, and perceptions to the study of virtual play. Combined, these strategies contribute to our understanding of virtual activity and allow us to explore the connections between mode of play, gender, and perceptions.

Review of Research Approaches to Traditional and New Media Studies

Early studies of virtual interactions took a traditional media effects approach, emphasizing content analysis and the link between *antisocial* or aggressive behavior and

violent content in video games. Surveys and controlled laboratory experiments are two common strategies applied to study the effects of media viewing on behavior. Some of the other issues addressed using these kinds of approaches are children's health and well-being – identifying, for instance, links between childhood obesity and video game addiction (Anderson & Bushman, 2001; Wimmer & Dominick, 2006) – Internet safety and access, the need for critical analyses of web content, the interplay of technology and identity, or the erosion of children's agency imposed by consumer culture (Cross, 2009; Grimes & Shade, 2005; Livingstone, 2003a, 2003b, 2006; Mazzarella & Atkins, 2010; Turkle, 1995, 2005; Willett, 2009).

A compelling body of pro-social research, however, also started to emerge in the 1990s, emphasizing the positive role video games and Internet use might assume in health communication, education, behavioral, and social change (Flanagan, 2006; Gee, 2007a, 2007b; Lieberman, 1997, 1999). Lieberman's research (1997, 1999) finds that video games promoting healthy messages show positive results for asthma and diabetes management, as well as smoking prevention. In her research, Flanagan (2006) examines activist games and Internet environments that embrace social values. One such game – *Peter Packet* – encourages players to use Internet technology to both learn about and solve the problems faced by youth in less developed countries, including issues such as “education, clean drinking water, and AIDS” (p. 494).

In both video game and Internet research, this more celebratory branch of research typically positions young people as active media content contributors who create fan fiction, produce videos for YouTube, and “mod” or modify video games as they dynamically shape their own experiences in virtual environments (Gee, 2007a, 2007b; Jenkins, 2007; Lenhart & Madden, 2005; Marsh, 2005; Mazzarella, 2005; Mazzarella & Atkins, 2010). The Internet is touted as a space for cultural and civic or democratic participation, and a safe place for self-expression (Center for Media Literacy, 2008; Cordes & Miller, 2000; Kellner & Share, 2005; Livingstone, 2003a, 2006; Mazzarella, 2005).

One prominent strand of research in video game studies, introduced in Gee's (2007b) seminal book *What Video Games Have to Teach Us About Learning and Literacy*, identifies how virtual play can also be supportive of creativity and knowledge construction overall. Good games, Gee asserts, allow players to be designers in their own right, providing players with software that allows them to modify games by building “new maps, levels, and scenarios, and sometimes even change the rules” (2007a, p. 136). He argues that the feelings of agency and control experienced in video game play lead to “good learning,” and that gaming literacy gives young people the competitive skills that are critical in a global, high tech world.

A number of HCI and social science research methods and strategies are used to explore such issues tied to young people and IVT use, including – but not limited to – content analysis, action research, participatory research, field studies, case studies, lab experiments, survey research, basic research, applied research, and normative writings. Another research method successfully applied to studies of IVT use, elaborated upon later in this chapter, adapts research methods associated with the collec-

tion, coding, and analysis of verbal streams of data. It is a method that is consistent with media content analysis used to determine, for example, the relative frequency of television violence (Geisler, 2004).

The impact of computerization and the virtualization of human activity has resulted in a transformation of a person's "whole system of motives, stable meanings of personality, and personality's goals" (Tikhomirov, 1999, p. 353). To understand the breadth and depth of the effects of IVT use on young people, a multifaceted, mixed method approach needs to be applied to the study of virtual activity. The purposes of such research are to:

- examine the ways in which activity unfolds in virtual environments over time;
- identify opportunities for creative or contributive interactions that support healthy development;
- understand the roles both IVT affordance recognition and use play in supporting or thwarting creative activity; and
- learn how subjective experiences and concepts of self are shaped by the performance of virtual activity.

The following sections present several research strategies to explore virtual activity and its impacts on young people's perceptions of their own creative agency. The various methods and approaches outlined here provide useful ways to develop a better understanding of virtual environments overall.

Experimenting With Mixed Research Methods to Study Complex Virtual Interactions

Mixed research methods were used in the following three studies to explore young people's interactions with web content and video games, and to measure perceptions of play that emerged in comparable virtual and physical activity. The first study applied methods adapted from verbal data analysis (Geisler, 2004) to investigate and compare how play activity unfolded at two popular children's websites. This study was critical in moving the focus of the research beyond activity to address perceptions.

The second study was conducted as an observational study to further investigate children's perceptions of virtual play. It extended the first study by comparing various physical play activities with similar virtual activities, in this case focusing on video game play instead of Internet interactions. Most importantly, this study explored whether *mode of play* impacts perceptions of creativity and control, and suggested the design for a third study.

The third and final study, conducted as a field experiment, was both inspired and informed by the two earlier studies. Following up on the findings of the second study,

it was specifically designed to measure whether or not changes to perceptions emerge in the performance of comparable physical and virtual play tasks. The third study also led to the development of the creative agency model, which provides a useful framework for future research.

Study 1: A Tale of Two Websites

One of the overarching goals of the first study was to develop methods to measure and assess how children engage in play online at popular commercial websites. Another object of this early study was to identify virtual activities that encouraged the expressive and constructive sorts of play recognized as being both supportive of healthy development, and also the kinds of play children say they prefer when interacting with technology (Druin, Bederson, Boltman, Miura, Knotts-Callahan, & Platt, 1999). To accomplish this, play activity at two commercial websites – Millsberry.com and Webkinz.com – was recorded and coded for analysis (see Figures 23.1 and 23.2).

The author's three daughters – ages 7, 9, and 12 at the time – participated in the initial study. The websites selected were ones at which the children were already playing. Two of the three girls gave consent to have play sessions recorded using screen capture technology, and all three made lists of the things they liked to do when playing at the two sites, and took part in discussions and demonstrations of

Figure 23.1 Screen capture of Millsberry.com

Figure 23.2 Screen capture of Webkinz.com

the various activities available. Working with one's own children in research is not unusual. Linguists, for example, have observed their own children to study how language skills develop. Child development theorists also study the behaviors of their own children. Jean Piaget (1962, 1970), for instance, worked with his children to explore the implications of childhood play on a developing child, and the ways in which young people both perceive and organize their experiences.

The research methods used in the initial observational study were inspired by approaches derived from the analysis of verbal data (Geisler, 2004). Verbal data analysis (VDA) methods are compatible with qualitative research approaches, and provide a way to identify units of analysis, calculate frequencies of specific types of activities, and explore behavioral patterns over time. Once data are collected, they can be segmented into units appropriate for analysis to identify the level at which phenomena of interest occur. For this initial study, however, VDA methods were applied to the analysis of *visual data* and virtual activity.

As indicated earlier, to analyze visual data, video screen capture technology was used to record streams of activity as the girls played at the two websites studied. Several sessions of online play were recorded for both children. Basic video editing software was utilized to segment visual data into discrete activity units or "a-units" for coding purposes; a-units were correlated to the time the girls spent engaging in a particular virtual activity. A-units are similar to the "play frames" described by literacy researchers Neuman and Roskos (1992), inasmuch as these are used to segment

“play that is bound by location and a particular focus of interaction” (p. 213). Three coding schemes were developed to explore play as it unfolded in real time.

The coding schemes created for this study considered the three types of interactions Druin et al. (1999, p. 66) identify as most important to young people: a variety of play options, an ability to interact with others, and “expressive tools that enable them to tell stories or build things.” The three schemes developed – coding for range of activities, coding for social activities, and coding for engaging activities – were designed to:

- calculate the range of activities a young person participated in during play, categorized as “high,” “medium,” or “low” based on the number of activities offered on the active screen or menu bar and the number selected;
- identify opportunities for social activity using site-based communication tools (coded as “social-responsive,” “social-unresponsive,” or “non-social”) based on whether the child made contact, attempted to contact, or was unable to contact another player online; and
- classify the types of activity engaged in with greater frequency using the terms “search,” “select,” “design,” and “direct” to provide descriptive information about the types of interactions that occur in web play environments.

Definitions of activity in virtual environments suggested by the work of Parés and Parés (2001) were useful for developing the third coding scheme. The authors describe activity in virtual worlds as explorative, manipulative, and contributive. *Explorative* refers to the ability to navigate within a virtual environment, *manipulative* indicates the ability to influence or control elements within that environment, and *contributive* suggests the ability to add to or modify the environment as a whole.

Building on Parés and Parés, the terms “search,” “select,” “design,” and “direct” were used to describe activities children participated in at both Millsberry.com and Webkinz.com. If a child navigated or clicked around the website looking for something to do it was coded “search.” If she chose an arcade game to play, or picked out clothing or food items for a virtual pet, the activity was coded “select.” If she decorated a T-shirt or customized an avatar it was coded “design.” Activities that allowed for more creative control (i.e., composing a song or making virtual movies using site apps) were coded as “direct.” Activities coded as either “design” or “direct” corresponded to practices that are considered to be creative or contributive.

The third coding scheme was particularly useful for understanding how interactions in web environments unfold over time. As indicated in the temporal charts of engaging activities, the terms “search” and “select” were used more frequently than “design” or “direct” (see Figures 23.3 and 23.4). Video capture recordings show study participants engaging mostly in game play at both websites, and interactions in virtual arcades or games of chance, typically involve searching for things to do and/or selecting games to play to earn virtual cash to buy (select) things (food, clothing, toys, furniture, etc.) for their virtual avatars or pets.

Figure 23.3 Temporal chart for an 8-year-old girl engaged in 22 activities at Webkinz.com during a play session lasting 17 minutes 22 seconds. No activities are coded as “design” and only three are coded “direct.”

Figure 23.4 Temporal chart for a 10-year-old girl engaged in 14 activities at Webkinz.com during a play session lasting 17 minutes 53 seconds. No activities are coded as “design” or “direct.”

Overall, the three coding schemes developed for this study offer useful ways to explore patterns that emerge during online play and can tell us more about:

- what children do when they visit popular websites;
- whether children play alone or with others;
- what activities support creative or contributive sorts of play; and
- whether similar patterns of play occur across different websites.

In addition to coding screen capture data, informal interviews were conducted with participants to gather more information about Internet play at Webkinz.com and Millsberry.com. Study participants were also asked to make a list of their favorite activities, which indicated a preference for activities that allowed them to be creative. Surprisingly, these kinds of activities were not engaged in with any frequency, at least not during the play sessions recorded and coded for the study. For additional information about the findings of this early study see Spina-Caza (2010).

The apparent disconnect between what the children said they *liked to do* and what they *actually did* might not be that unusual for two reasons. First, as Druin (2002, p. 2) observes, “Children are extremely honest in their feedback and comments concerning technology, but much of what they say may be in their actions and therefore, needs to be interpreted within the context of concrete experiences.” And, second, as Hayes (2008, p. 103) found out in a study conducted on the topic of content creation, girls do not engage in such activity as frequently as boys:

While gaming may be pervasive, game content creation is not. Less than half of respondents who gamed reported engaging in any kind of content creation . . . Perhaps most clearly, just as gaming itself is a gendered practice, content creation is also gendered. While many girls are now gaming, they were much less likely than boys to engage in any kind of content creation.

As this study was conducted with girls only, it was clear that future studies of this kind would need to include both boys and girls in order to better understand the role of gender in virtual play.

Observations of online play in this first study suggest that a child’s subjective experience, or his or her perceptions of what happens when interacting with virtual environments, may be key to our understanding of how IVT use impacts human development. Wachs (1991), who argues that environment and experience are not necessarily synonymous, notes that a “child’s perception of the environment, rather than objective reality may be critical in influencing developmental outcomes” (p. 52). The need for research exploring how perceptions might be altered by virtual interactions is underscored by Bronfenbrenner (2005), developmental psychologist and founder of Head Start, who argues that perceptions emerging from activity “can contribute in powerful ways to shaping the course of development in the future” (p. 5).

To expand upon this early research we decided to further explore perceptions of creativity and agency as these were formed in the context of virtual play. To this end, a follow-up study was conducted over several weeks with 15 children in grades 4 through 8 attending a 4-H after-school program.² In this study, young people’s interactions with comparable real and virtual objects were observed to develop an understanding of how transferring physical activity to virtual environments can influence feelings of creativity and control.

Study 2: Redefining the Problem Space, Extending the Research Focus

The second study used a participatory research strategy inspired by Druin (1999) called *cooperative inquiry*, an approach often taken when designing technologies for children with children on a more or less equal footing. According to Druin (1999), while cooperative inquiry is unique as it involves children, it is grounded in HCI research and theories such as participatory design, contextual inquiry, and situated action:

Cooperative inquiry is an approach to research that includes three crucial aspects which reflect the HCI literature above: (1) a multidisciplinary partnership with children; (2) field research that emphasizes understanding context, activities, and artifacts; (3) iterative low-tech and high-tech prototyping. (Druin, 1999, p. 593)

In this study, a similar approach was used to advance our understanding of how young people perceive their interactions with virtual technology. Study participants were invited to be our research partners and to think about the different types of games they played, and whether these games and toys – both physical and virtual – allowed them to be more or less creative, or more or less in control over play. Handwritten observations describing free play activity, informal interview notes, and a “wrap-up survey” were the only instruments used to collect play data.

The hands-on board games and construction toys used in the study were matched with similar video games for the PC and Wii platforms. For example, both *Kabookii* (Ubisoft, 2007) for the Wii – a video game based on the popular board game *Cranium* – and the actual board game were used in the study. Physics games were also used, including *Professor Heinz Wolff’s Gravity* (Deep Silver, 2008), a virtual marble run, and the *Chaos Tower*, a physical construction toy and marble run (see Figures 23.5 and 23.6).

Several key observations emerged from the second exploratory study. During the informal interviews that were conducted in the workshops, the physical board games and construction toys were identified as being most supportive of creative sorts of play. Interestingly, video games were not perceived as offering opportunities to be creative. When asked which games afforded greater control over play activity, participant responses were not as cut and dried. Eight of 13 children interviewed (two boys and six girls) reported feeling more in control when playing with physical objects, and five (two girls and three boys) responded feeling more in control during video game play.

At the end of the six workshops, participants were asked to fill out a “wrap-up survey” identifying which games or toys they perceived allowed them to be more creative, and which afforded more control over play activity. Responses, however,

Figure 23.5 Chaos Tower physical marble run

Figure 23.6 Screen capture of *Professor Heinz Wolff's Gravity*, a virtual marble run video game (PC version)

were mixed. The surveys show a large number of study participants felt play with the Chaos Tower was more creative and that they had more control over play activity. The PC version of the *Gravity* video game was also identified by nearly as many participants as allowing for both creativity and control. Interestingly, study participants who played *Gravity* using the Wii felt both less creative and less in control of play.

While this second study did not specifically look for gender differences, observation notes indicated girls and boys played differently with the physical and virtual games and toys. A few boys freely shared hints to help others figure out how to solve puzzles or what to do in video games. Boys also took charge of physical, hands-on building activities, and were more likely to improvise how they built the Chaos Tower. Girls were more apt to construct the Chaos Tower according to the written directions, and also found themselves in the role of helpers or, at times, excluded from play. One 10-year-old girl was observed:

working silently, following directions, trying to build the [Chaos] tower. Boys excluded her. Girl offers to help get pieces, boys say they don't need help. [S]he continually tries to be included in the building process. Boys let her get certain pieces for them. She wants to help but doesn't know how. She observes as the boys build it. (Spina-Caza, research notes)

The purpose of this second, participatory study was to gain a better understanding of how physical and virtual play unfold in naturalistic settings. It was also conducted to inform the design of a larger, more controlled field experiment. The observations made in this study suggested the following changes to a future study to avoid potential confounds:

- already tested, valid survey instruments would be used to measure creativity and agency perceptions to see if results support the exploratory findings;
- subjects would be randomly selected to participate in either a physical or a virtual treatment, but not both;
- the virtual task would be performed using a PC, not the Wii, since perceptions of play using the Wii controller were not as positive and could confuse results;
- an equal number of girls and boys would be invited to take part in the study and be grouped by gender.

The second study allowed us to investigate children's interactions with comparable physical and virtual games and toys in a naturalistic research setting; to identify, with young people, perceptions of their own creative abilities in the contexts of virtual and physical play environments; and to bring into focus key issues associated with moving activity from physical to virtual spaces. Most importantly, it was useful for designing a research plan for the third, experimental, field study. The third study, which further extends this research, used a pre- and post-test design to identify self-perceptions as these emerged through the performance of physical and virtual play.

Unlike the first two studies, the third study also considered the role gender plays in perceptions of IVT use.

Study 3: A Conceptual Framework for Virtual Studies

Activity theory (AT) identifies creativity and agency as critical components of how knowledge is constructed and meaning is produced; both are also associated with learning through play and consequently warrant further study in the context of youth and IVT use. The third study, conducted as a field experiment, extended the earlier studies and examined the connections between mode and gender on creativity and agency perceptions as these emerge through physical and virtual activity. To this end, the creative agency model, or CAM, was developed to guide virtual research exploring the effects of IVT use on young people.

The CAM provided a conceptual framework for the overall experimental design of the third study. It built on existing research and theory by offering a formula to express creativity and agency as emergent factors of both subjective and objective aspects of human activity. Bronfenbrenner's (1981, 2005) formula for understanding development in context, or $D = f(PE)$,³ which posits human development is a process or a joint function of a person's interactions with his or her environment, was the inspiration for the CAM formula presented here:

$$C + A = f_{(g)}(VrAc) + (PfPc)$$

This formula does three things: first, it identifies creativity (C) and agency (A) as core dimensions of human development that can be measured; second, it defines C and A as both functions of virtual activity (VrAc) and emergent properties of performance perceptions (PfPc); and third, it recognizes gender (g) as a key dimension.⁴

The CAM, combined with self-perception measures such as the two instruments used for this study, can help us identify how technology environments might encourage the creative, contributive, and child-directed sorts of play that are associated with psychological development and cognitive growth. It also underscores the role environmental *affordances* play in these processes. The term "affordance," as it is used here, refers to "a three-way relationship between the environment, the organism, and an activity . . . centered on the notion of an organism acting in an environment: being in the world" (Dourish, 2004, p. 118).

The CAM formula proposes that it is through *activity performance* that human agency and creativity transpire. It posits that a person's perceptions of his or her own abilities, which emerge in the performance of virtual activity, are crucial to human development in general. CAM acknowledges all activity is situated in specific environments, but focuses attention on the role environmental *affordances* play in facilitating

Figure 23.7 Creative agency model (CAM)

or constraining activity in virtual settings. *Perceptions* are placed at the center of the model (Figure 23.7) because the ways in which young people perceive their own creative abilities or agency in the performance of either virtual or physical activity may, as pointed out in the first study, be more critical to development than objective reality (Bronfenbrenner, 2005; Wachs, 1991).

The CAM model offers a potential way to conceptualize creative agency perceptions as these emerge through activity performance. It also provides a useful formula for measuring whether or not young people's feelings about their own creative abilities increase or decrease when participating in comparable physical or virtual activities.

Measuring Perceptual Shifts in Physical and Virtual Play

In addition to using the CAM framework to guide this research, the experimental study also utilized existing psychometric measures to quantify perceptual shifts based

Figure 23.8 Fourth-grade study subjects participate in the physical/video treatment

on activity performance. The design of the field study centered on two treatment conditions, a physical/video task and a virtual/web task. Subjects participating in the physical/video treatment (Figure 23.8) were invited to make movies using physical affordances (video camera, tripod, puppet stage, and handheld puppets), while subjects assigned to the virtual/web treatment (Figure 23.9) made movies using virtual affordances (the Webkinz Studio application at Webkinz.com).

The children who took part in the study were randomly assigned to either the physical/video or the virtual/web treatments and were grouped by gender. Data was collected using the Khatena–Torrance Creative Perception Inventory (Khatena & Torrance, 1998). The KTCPI is composed of two self-report survey instruments: “What Kind of Person Are You?” (WK) and “Something About Myself” (SAM). Both instruments include dimensions generally associated with creativity and agency, and were administered as pretests three weeks prior to the experimental treatments. The same surveys were later administered a second time as post-tests, immediately following treatments or task completion.

The field experiment included three phases of data collection. In Phase I, the two survey instruments were administered to all of the study cohorts, including the control or wait list group, during the regular morning homeroom period by 4th- and 5th-grade teachers. The researcher met with all of the teachers and provided them with verbal and printed instructions to assist them in the administration of the KTCPI instruments to students.

Figure 23.9 Fourth-grade study participants making movies in the virtual/web treatment

In Phase II, cohorts, grouped by grade level and gender, were asked to make short movies using video production equipment in a physical environment, or a web movie-making application in a virtual production environment at Webkinz.com. In order to insure task interventions were comparable, physical sets were purposely selected and created to resemble virtual settings. An artist was commissioned to paint two backgrounds for the tabletop set to closely match two of the backgrounds in the Webkinz Studio application (see Figures 23.10 and 23.11). To make the physical and virtual conditions as similar as possible, hand puppets were selected for the physical treatment that closely matched the virtual characters.

In each condition study participants were able to write and direct their own movies (see Figures 23.12 and 23.13). In the physical/video condition subjects took turns at being director. Directors were given control over running the video camera and could direct puppet actors in movies based on their own scripts. In the virtual/web condition each participant could also direct virtual actors in movies based on the skits they had written. Both the physical and virtual movie-making activities were videotaped for research purposes and provided additional information that could be used during the analysis process and discussion of results.

In Phase III the control and treatment groups were expected to repeat the two KTCPI survey instruments. Post-task measures included brief, informal exit interviews designed to assess what types of affordances participants recognized as being available to them when performing either the physical or virtual tasks.

Independent Variables

The three independent variables in this study included:

- the *physical condition* (video movie-making task);
- the *virtual condition* (web movie-making task); and
- *gender*: students were randomly assigned to groups by grade level, isolating for gender.

Dependent Variables

The dependent variables in this study were two self-report measures typically used for measuring creativity perceptions and drawn from the Khatena–Torrance Creative Perception Inventory:

- the forced-choice attitude survey “What Kind of Person Are You?” (WK), developed by Torrance (Khatena & Torrance, 1976, 1998);
- the autobiographical creativity assessment inventory “Something About Myself” (SAM), created by Khatena (Khatena & Torrance, 1976, 1998).

Self-reports measuring perceptions and attitudes are often used to measure creativity (Fishkin & Johnson, 1998). The KTCPI is one such measure, consisting of two different inventories listed above. SAM is an autobiographical instrument based on “the rationale that creative functioning is reflected in the personality characteristics of the individual” (Khatena & Torrance, 1998, p. 6). According to Khatena (1977, p. 517) autobiographical instruments can be used to measure self-perceptions:

Perception can be related to creative components of personality which when operationalized will allow for measurement . . . If propensity for creative behavior is to be measureable, creativity needs to be operationalized or broken down into specific behaviors.

WK is a self-report inventory used to identify creatively oriented individuals. It requires subjects to reflect on and to choose from various creative and noncreative characteristics that most closely apply to them. The WK inventory is “based upon the rationale that the individual has a psychological self, whose structures have incorporated creative and non-creative ways of behaving” (Khatena & Torrance, 1998, p. 10). Most important to the virtual research conducted in the field experiment, the WK instrument is described as a composite of sub-selves triggered by an individual’s interactions with his or her environment.

The experimental study had a wait list/control group that closely mirrored the experimental groups, and early plans included pre- and post-testing of both experi-

mental and control groups. A decision was made, however, to conduct post-tests following the two experimental treatments, as it was important to determine whether or not we could establish direct links between the treatments and changes to self-perceptions. Among other things, this decision resulted in shorter time intervals between pre- and post-tests. While longer time intervals are recommended, shorter intervals are useful in some instances. As Buddenbaum and Novak (2001, p. 128) point out, "Studies using a very short time interval will measure short-term effects. For longer-term effects, a second set of observations at some later time may be added or the interval between pretest and posttest may be increased." Future research conducted using the CAM model will consider longer-term effects.

To supplement the pre- and post-test data collected, qualitative data were also gathered to identify what affordances were used in the movie-making process, and to point out the possibilities and the constraints associated with these affordances as they are articulated in children's own words, or depicted by their actions during the experimental treatments. Several key questions associated with affordance use can be addressed using this type of qualitative analyses. For example:

- 1 Is the ability (or inability) to recognize and use affordances in physical and virtual environments connected to increases or decreases in creativity or agency perceptions?
- 2 Are there gender differences associated with affordance use and creativity and agency perceptions?
- 3 If gendered differences are linked to affordance recognition and use, do the differences support the findings of the current study?
- 4 What contributions can such findings make to the study of children's IVT use?

Qualitative data collected for this third study includes videotape recordings of participants performing the physical and virtual tasks, and the final movies made during the experimental study. These data have yet to be analyzed. However, some of the things we will be examining include participant statements, off-hand comments, and questions recorded in the videotaped observations. Verbal data analysis techniques will be used to identify any phenomena connected to creativity or agency perceptions and gendered practices.

In addition to the coding of verbal data, visual data will be segmented into activity units that can also be coded to identify, among other things, the frequency and range of affordance use. For example, in their finished movies, how many times did study participants recognize and use the affordances available to them in the physical/ video or virtual/web treatments? Did they alter the framing or the types of shots used to make their movies? Did they add music or change set backgrounds? Did girls recognize and use affordances more frequently than boys?

The importance of conducting qualitative analysis of the physical and virtual treatments is threefold: (1) qualitative findings can confirm or complement the significant findings reported in the experimental study; (2) new findings may be revealed that

enrich the experimental study; and (3) unexpected findings may come to light that necessitate further investigation.

The study of complex systems requires more complex, multilevel approaches to research exploring new media technology, particularly for studies attempting to capture or measure subjective experience or perceptions. In this study, we measured creativity and agency perceptions as these emerged in physical and virtual play. Our preliminary quantitative data analysis indicates perceptions are related to mode. Significant results were reported for both paired samples *t* tests and independent samples tests, indicating a possible relationship between how an activity is performed and self-perceptions. Positive effects were noted for three of the four creativity dimensions we studied and for one agency dimension, but only in the virtual condition, and all of these were gendered.

Overall, girls who took part in this study showed a positive increase in creativity perception scores across three dimensions, while boys demonstrated an increase for only a single agency-related variable. Negative effects, however, were found for two of the other agency dimensions in the virtual/web condition only, though these do not appear to be gendered.

Secondary analyses of the qualitative data collected for this research will shed more light on the various phenomena identified in the pre- and post-test results. The triangulation of data in mixed method approaches can verify or confirm that notable trends are not simply the result of study methods or limitations, and can also provide critical information to improve the design of future studies.

The Importance of Isolating for Gender

As the research presented here demonstrates, studies that explore young people and IVT use would be remiss not to consider gender as a contributing variable. Gender differences exist in how children interact with the physical environment and are also found in studies of Internet and video game use. Research in gender and literacy practices, for example, indicates that childhood objects and toys, the characteristics of different play settings, and the activities performed in these settings all influence how children interact with each other and their environment (Cassell, 1998; Heath, 1983; Jenkins, 2006; Laurel, 2003; Thorne, 1993).

Research on computers, Internet use, and video games indicates gender differences have an influence on IVT use. Colley (2003), for example, who examines gender differences associated with how computers are perceived in school settings, explains, "Girls approach computers as tools for accomplishing tasks, while boys approach them as technology for play mastery" (p. 673). Cassell (2002, p. 4) notes that girls not only participate in different types of virtual play from boys, but are also often treated differently in the context of computer use.

first grade girls working on the computer in mixed-gender groups were more likely to be laughed at, criticized and have their competence questioned than when they were working alone or in all-girl groups. In addition, the girls were frequently interrupted by male students, whereas the reverse was not true.

According to Heeter and Winn (2008), video game play, when it occurs publicly, becomes gendered. The author's note that at school, where computer screens are visible to classmates, young people "compare progress and performance" (p. 283). Hayes (2008), who studies the connections between content creation and IT proficiency of middle-school-age girls, recommends girls *not* work in mixed gender groups, and suggests researchers design experiments "in which girls can explore gaming and related creative practices without male competition" (p. 106).

Due to the many instances in which gender differences emerge for how young people approach both physical and virtual play, and because it appears that girls not only play differently from boys but also alter their behavior with technology when boys are around, it is imperative that studies of IVT use also isolate for gender to avoid mixed-gender confounds.

Complex Virtual Interactions Call for Complex Methodological Approaches

The research approaches described here bring various strategies to the study of virtual activity. An early study, influenced by literacy research and studies of popular children's websites, was conducted to identify opportunities for informal learning and creativity in Internet play environments. It contributed useful ways for measuring and assessing online play environments using visual data analysis techniques. While the study concluded that opportunities for creative and contributive play exist at commercial websites, children's perceptions of what they did when playing online differed from their recorded actions. The initial study suggested that subjective experience, in the form of self-perceptions, plays a crucial role in our understanding of virtual interactions.

A second research project, inspired by the first, extended the scope of the earlier study by exploring perceptions emerging from both traditional and virtual play activity. It took a participatory approach that embraced participants as research partners, as do many studies in the field of human-computer interaction. The overarching purpose of this study was to inform the design of a larger, experimental study.

The third study, conducted as a field experiment, employed both quantitative and qualitative data collection strategies. It, too, explored similar physical and virtual play activity. Most importantly, this study produced the creative agency model (CAM), a useful framework for understanding how self-perceptions that emerge through

physical and virtual activity are impacted by variables such as gender and affordance recognition. Together, these various methods offer complementary research tools that can expand our understanding of how activity unfolds in virtual environments, as well as the overall impact of transferring activity from physical to virtual settings on how people play, develop, and learn.

Finally, several fundamental questions are raised by research contrasting physical and virtual modes of play:

- 1 What do we want to measure, and how will we measure it?
- 2 Will we use or adapt existing measurement tools or create new ones?
- 3 What can we learn by identifying perceptions of creativity and agency as these emerge in the performance of physical and virtual activity?
- 4 What else ought we to be measuring?

To answer these and similar questions we need to consider the goals of such research. Are we trying to determine which physical activities transfer best to virtual environments? Are we developing or advocating the use of virtual technology, including video games, Internet sites, and mobile applications, for informal or formal learning? Are we trying to positively influence design to develop technology that supports, extends, or enhances human activity? Are we making and marketing new technology to young people? And, if the purpose is purely a commercial one, can we enrich IVT design so that it considers young people as active participants in shaping virtual culture and supports their goals and desires?

Whatever questions are posed, whatever research methods are selected, adopting approaches that are informed by the performance of activity in ecologically sound contexts can provide more accurate information about which types of environmental affordances – physical and/or virtual – produce positive creativity and agency perceptions that are believed to be vital to human development in the long run.

NOTES

- 1 The phrase “interactive virtual technology” (IVT) was used in this research because it is more inclusive of activity that happens in Internet or Web environments, video games, and/or other digital play spaces. “Information technology” (IT) and “information communication technology” (ICT), while often used to describe technology in the context of computers and communication, or the management of information, are terms that can be all-encompassing; however, they do not necessarily conjure up playful activity. “Virtual reality” (VR) or “virtual reality environment” (VRE) were also considered, although these terms are sometimes associated with specialized, highly immersive, 3-D environments, and simulations, which are (at least for now) less accessible. IVT embraces a variety of digital activities, and as activity is the focus of this research, serves the purpose well.
- 2 4-H is a youth program sponsored by the United States Department of Agriculture that focuses on “hands-on learning programs in the areas of science, citizenship, and healthy

- living” according to the organization’s website (retrieved August 1, 2013, from <http://www.4-h.org/about/youth-development-organization/>).
- 3 Bronfenbrenner later revised the formula to $Dt = f(t - p)(PE)(t - p)$ to account for developmental changes at the time (t) in which developmental outcomes are observed, and the period (p) during which interactions between person and environment “operate to produce the outcome existing at the time of observation (t – p)” (Johnson, 2008, p. 4). (The variables associated with Bronfenbrenner’s formulas for development are reproduced as they appear in the sources, in roman type.)
 - 4 The flexibility of CAM allows gender (g) and other independent variables such as socioeconomic status, race, or ethnicity to be factored into the equation to determine whether these, too, might play a role in perceptions of IVT use. Other types of activity can also be examined or compared to determine impact on creativity and agency perceptions (i.e., physical activity or mixed reality activity using tangible or computational objects).

Exploring the Effects of TV and Movie Music on Childhood

Amparo Porta

ABSTRACT

In recent years the relations between childhood and the mass media have been the subject of an increasing number of studies conducted by researchers from the fields of communication and education. Their link with cultural diversity, heritage, habitat, and identity has made them the focus of psychological, multicultural, and critical pedagogic studies. The aim of this chapter is to determine how childhood is affected by one of the poles of the audiovisual binomial, namely, the music present in movies and television, which is included as their soundtrack. The article explores several descriptive paths from a semiotic approach, analyzing both the contents and the music in order to answer two questions: What is listened to in children's TV programs and movies? And what is that music like? Finally, some soundtracks are examined with the aim of discovering the effects of this everyday music that, through movies and TV, speaks to the child about the Other and his or her cultural dominance and values.

In recent decades numerous authors and disciplines have been interested in the effects of the mass media in childhood and adolescence. The object of this chapter is the act of listening in the daily sound environment, and the effects produced therein by the mass media, such as cinema and television. The music offered daily in the mass media includes cognitive, social, emotional, and patrimonial elements that all affect listeners' experiences (DeNora, 2000). This text is part of a wider research study focused on listening, which is also aimed at developing objective instruments based on the language of music. To achieve these goals one must keep in mind which sound object is referred to, which type of sound landscape the sound object is located in, and which characteristics the sound object possesses. After producing and applying three instruments (musical analysis, a listening checklist, and analysis of the musical discourse), the soundtrack of several children's TV programs and movies were studied in order to determine their effects using qualitative and quantitative analysis techniques.

The musical characteristics were investigated using a checklist made up of categories that facilitated quantitative analysis, while the musical discourse was studied using content analysis. Cinema and television are similar in some respects, but they also present a number of important differences. Consequently, the research examined both TV programs for children and an animated film (*Happy Feet*, 2006). The study started with a descriptive phase aimed at identifying objective elements in the music, followed by an interpretive analysis focusing on the discourse, and exploring the meaning that music has for the child audience – the term “meaning” taken here as used by Greimas and Courtes (1982). The research focused on cinema and TV program soundtracks since they have been identified as having substantial educational influence. The core question of the research concerns what children listen to in cinema and TV programs for children.

Method

The methods of analysis chosen in this study include musical (Zamacois, 1987), sociological (Krippendorff, 1990), and semiotic analyses (Talens, 1995). *Music speaks with its own language*, so the elements included in the sound environment (i.e., tone, timbre, intensity, and rhythm); the structure (i.e., the musical form); and stylistic and timbric options have been studied in depth (Zamacois, 1987) (see Figure 24.1).

Music speaks to everybody (see Figure 24.2). By means of the sociological analysis of texts and discourses, the study accessed the nonobservable aspects of the musical analysis. In discourse, the unreachable truth is replaced by credibility, which refers to the reliability and consistency within the context of the discourse. Hence, the above-mentioned elements were approached on three different levels: nuclear credibility, poetic and logical credibility, and topical credibility (Krippendorff, 1990). Nuclear credibility shows the basic characteristics of musical language (Figure 24.1), whereas

Source: Porta, 2007, 73.

Figure 24.1 Methodology for analyzing soundtracks

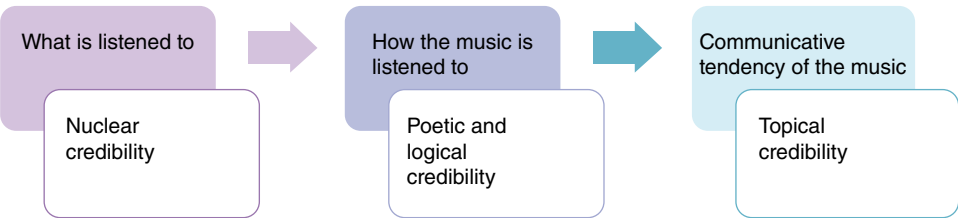

Figure 24.2 Music speaks for everyone: levels of credibility

poetic and logical credibility reveals the organization within the communicative chain by means of the musical form, genres, and stylistic and timbric features. This second level addresses the question of where the music is located and how it is constructed. Finally, the third level (topical credibility) allows us to observe the communicative tendency of the discourse as a whole, that is, to consider the music’s ideological positioning while taking into account the fact that music is received in a private, individual manner (Porta, 2007). In other words, this level concerns the elements and syntax of the musical language.

The procedure followed consisted of three stages: (1) studying the quantitative musical features by applying the checklist mentioned above; (2) studying the songs and musical works through a musical analysis; and (3) analyzing the contents of the musical discourse, and examining how they are related to the story and other audio-visual narratives.

General Approach of the Study

This study explored cinema and television soundtracks as well as their effects, taking the semiotic framework as its theoretical reference because of its interest in the making of meaning, that is, in the individual's position within the discourse (Lozano, Abril, & Peña-Marín, 1982; Talens, 1995; Zunzunegui, 1989). The methodological foundation in musical semiotics was based on Adorno (1972), Molino (1975), Nattiez (1990), and Gauthier (1996). The analysis was performed using a procedure described by Umberto Eco. In the introduction to *The Absent Structure* Eco states that semiotic research makes sense only if the field structure is assumed to be an imprecise entity that the method intends to clear up. Hence he proposes the following points as a methodology: (1) comparing definitions; (2) establishing the semiotic field in terms of vastness and disorder; and (3) creating a research model subordinated to contradiction. This way, if the procedure is successful, something which appears utopian – that is to say, “maintaining the complexity of the field by granting it a structure, and thereby transforming that field into a system” (Eco & Cantarell, 1978) would be achieved.

Following Eco, the operating hypothesis of this research was to transform the field of study into a system, which requires the use of suitable instruments. The problem of measurement instruments in music is not new. Indeed, two different approaches to sound analysis appeared back in the 1960s and 1970s. Pierre Schaeffer's (1966) sound object, on the one hand, was based on a phenomenological analysis that focused on the modes of auditory perception. On the other hand, Robert Murray Schafer's (1977) notion of *soundscape* dealt with what might be labeled the “compositional” representation of the sonic environment. He also called for new solutions to new demands and claimed that the various fields of sound studies are in need of what amounts to a revolution. Finally, Atienza (2008) criticized this approach and stated that the sound object, which is to be the elemental unit of a “solfeccio of sound,” lacks a suitable scale for analyzing such complex configurations as those found in urban settings.

The Sound Medium

From a cultural and educational position, in accordance with Atienza (2008), we can say that the sound object is not really an *object* at all, nor is it responsible for the sound matter as an object, but, rather, as a medium. Consequently, the question about sound itself, addressed by Schaeffer and Murray Schafer, remains. The aim then is to study the sound in terms of a precise moment in time and space. Jean-François Augoyard (1989, p 21) and the Cresson laboratory are in fact the heirs of both conceptions. This research line arises from the need to find an interdisciplinary

tool adjusted to the scale of an urban configuration that allows for the integration of dimensions other than the purely esthetic one (Atienza, 2008). The Cresson laboratory in Grenoble established a survey protocol that indicates a change in paradigm that rests on three key premises related to the description, the itinerary, and the experience.

The first of these three terms refers to the study of the musical elements that are listened to, while the second deals with their position in the sequence or program and how they are associated with the characters and set design (place, roles, etc.). The third concerns the observation of the child's identity traits, presence, and projection in the story in order to determine the degree of influence and dominant ideology. The main contribution in this case is that the parameters have been enlarged to include both contextual and experiential data. Therefore we no longer speak of just music or sound art, but of its position in the temporal and narrative structure of the audiovisual media. This means that in this new definition of listening space, the contents related to one's own identity (De Moragas, 1991), as well as the communicative, aesthetic, and patrimonial values in education, are all affected. Thus, this study aimed to analyze that part of the contemporary sound habitat that is produced industrially and designed to have a strong, far-reaching impact across society. Accordingly, it made use of musical formulae that were adapted to the mass media in order to insure it built a wide audience.

The Model

Models that attempt to explain how music is represented mentally vary in terms of the range of phenomena they explain and the categories they propose (Gómez-Ariza, 2000). Yet, few studies have systematically reviewed each of the factors that make up music and the influence they have on the way musical information is perceived and remembered. According to Gómez-Ariza, one of the difficulties hindering this type of review is that there is no unifying theoretical framework that allows existing data to be organized. The model used here is one that was created by Gómez-Ariza and which allows these data to be unified.

The notes in the melody, the intervals, and the tonality are all variables that determine the combination of sounds that make up music (musical phonology). The rhythmic pattern, the accents, and the rules of formation are essential to carry out the processes of segmenting a piece of music (musical syntax). Finally, tonal hierarchies and structure organize the music while also generating musical expectations, which, together with other expressive factors such as the tempo or the timbre, seem to generate affective responses to music (the semantics of music) (Gómez-Ariza, 2000).

Drawing from this research, the study considered the diverse dimensions of the musical stimuli that combine to constitute the complex auditory pattern that makes

up music. In addition to dimensions related to the mental representation of music, music also takes place in time, so the study must be anchored in time in such a way as to allow the following questions to be answered: What is listened to, and where is what is listened to located? As noted, the definitions of the Cresson laboratory add the concepts of description, itinerary, and experience to the methodology. The descriptive part is understood to mean the characteristics of the music, while the itinerary refers to the planning of the story and its sequences in movies and the different sections that appear in TV programs (i.e., advertising, cartoons, and in-house material, as well as the songs in the opening sequences and the position of the other songs). Experience deals with the leading songs and the study of their cultural features, together with the representation of the world and the values that are offered. In short, here we are dealing with nuclear, poetic, and logical credibility.

Instruments

Three main instruments were employed in the study. The first two – musical analysis and the listening checklist – were used to gain an understanding of musical pieces in the media and their constitutive elements. Musical analysis makes it possible to determine what the music is like. The checklist was used to describe the music's 13 basic elements quantitatively. The third instrument, analysis of musical discourse, explored the meaning of the music within the audiovisual and cultural medium. This is the point at which the levels of credibility are applied to give account of the presence of the viewer, that is, the child, within the discourse offered by cinema and TV.

These instruments and considerations were applied to a TV program for children entitled *Los Lunnis* (2008) and also to the movie *Happy Feet* (2006). The checklist for listening took into account 14 indicators corresponding to the more representative sound qualities to be measured. This checklist had already been validated and applied to other audiovisual documents. The analysis variables, to be further detailed below, were the following: without sound; nonmusical sound; musical sound; voice; meter and rhythm; beginning type; dynamics; agogic; genre and style; sound organization; cadence; modulation; sound texture; and sound plane (Porta & Ferrández, 2009). The instrument was produced in four phases: (1) the construction of the pilot checklist; (2) validation by expert opinion; (3) second checklist; and (4) intercoder validation. Validation was carried out by means of the crossed judgments of three independent coders on 22 units of analysis for the same program, the results showing a mean rate of agreement above 80%, which was considered to indicate that the instrument had a very high level of reliability (Porta & Ferrández, 2009).

The checklist was created taking into account the most representative measurable music and sound characteristics. As a result, the following variables for analysis were established:

- 0 *No sound.*
- 1 *Nonmusical sound:* this indicator refers to sound that cannot be measured with musical parameters.
- 2 *Musical sound:* this refers to the qualities of sound that allow musical components to be discriminated and distinguished.
- 3 *Voice:* this refers to sound produced by the human vocal apparatus.
- 4 *Meter and rhythm:* (a) *Meter* refers to the hierarchical organization of time levels or measures. (b) *Rhythm* refers to the distribution of sounds on the time continuum.
- 5 *Type and beginning:* (a) *Anacrusis beginning:* this refers to one that starts before the phrase begins. (b) *Acephalous beginning:* this refers to a phrase that begins with a silence. (c) *Thetic beginning:* this refers to a phrase that begins on time.
- 6 *Dynamics:* this refers to everything related to the degrees of intensity of the music.
- 7 *Agogic:* this refers to aspects of the performance related to the duration and, consequently, to the tempo.
- 8 *Genre and style:* (a) *Musical genre:* this refers to musical compositions that share different affinity criteria. (b) *Style:* this refers to the form of the discourse and the particular way in which a piece is performed.
- 9 *Sound organization:* this refers to the musical syntax and the modal or tonal (major or minor) organization of Western music.
- 10 *Cadence:* this refers to the process of falling to a tonal center. The different cadences can be classified as conclusive, if they generate a certain degree of stability or rest, or suspensive, if they generate instability or tension.
- 11 *Modulation:* in tonal music, this indicator refers to the process of moving from one tonality to another or the result of such a shift.
- 12 *Sound texture:* this indicator allows us to gain a better understanding of spatial organization and how it is articulated with regard to performances, composition, and analysis. Types of texture include: (a) monophonic; (b) polyphonic, which in turn may be (i) horizontal polyphony or (ii) vertical polyphony; and (c) accompanied monody.
- 13 *Sound plane:* this refers to the vocal and/or instrumental groups that jointly intervene and determine the situation of the different sounds, whether this is temporal, physical, or related to the intention of those sounds.

The narrative structure of three sections of the television program – content produced in-house, nonlocally-produced cartoons, and advertising – together with the musical numbers and songs in the movie, were all examined. The nuclear credibility of the music was considered first to determine its specific characteristics, and an examination of the poetic and logical credibility of the musical texts made it possible to determine the way musical discourse is built. This approach shed light on the music's topical credibility, and its discursive and ideological tendencies (Porta, 2007).

The paradigm, model, and methodology were selected so as to answer the key question: *What do children listen to in TV programs and children's movies?* This phase of analysis resulted in a better understanding of the content of the soundtracks and of how they represent the world. This research, however, also proposed to explore the social, communicative, and educational dimensions of music.

Rationale: Children and the Music of the Media

According to the *Pigmalión* report (Del Río, Alvarez, & Del Río, 2004), the mass media, especially television, have become a key means of constructing reality for children today. Some of the most important works on television music include those by Beckers (1993) in Germany, Bixler (2000) in England, and Magdanz (2001) in Canada. Others include those carried out on the program *Sesame Street*, in particular the study conducted by Wolfe and Stambaugh (1993), who proposed the observation, classification, and detailed description of the musical elements of the program as initial objectives for later research on music-therapy-based learning for young children. Equally noteworthy is the work carried out by Valdivia on the cultural dimensions of the media (Valdivia, 1995, 2004, 2010). Spanish-language research on the subject includes the work by Herrera, Cremades, and Lorenzo (2010) on musical preferences in adolescents, and TV and animated movies (Porta, 1998, 2007). Our own research group has also conducted research on children's TV programs in Latin America (Porta, 2010).

The changes experienced in contemporary Western societies with the proliferation of new technologies make it necessary to search for new strategies to protect the rights of children both as citizens and as consumers (Buckingham, 2002). One of these rights is education, one of the purposes of which is to prepare individuals to cope with the difficulties of the times they are living in (Aronowitz & Giroux, 1991). Moreover, critical pedagogy contends that being culturally literate means being in possession of the basic information needed to prosper in the modern world (Aronowitz & Giroux, 1991). Similarly, multicultural pedagogy defends the social characteristics that define the Other, and denounces social and educational policies that are only interested in adapting to the needs of the market (McLaren & Kincheloe, 2007; Morley, 2002). Finally, Hargreaves and North (1999) looked into the psychological functions of music in everyday life and proposed focusing tasks on the social dimension, so as to be able to consider the interdisciplinary context, the effects of "democratizing" music, the role played by theory, the relationship between theory and practice, and the implications for the research methodology.

It is important to bear in mind that cinema and television are references for children, since they provide them with a representation of the world prior to any real experience and reflexive knowledge (Vygotsky, 1981). Music, image, and narration are always present in cinema and television, in a process that produces a unique,

single meaning within the child audience. To find out what the music in children's programs is like and how it is constructed, an analysis of the musical characteristics of the songs, the fragments, and the motifs found in the three sections of the television program identified above was performed, focusing specifically on the timelines and the cuts in regular periods. On the other hand, in animated films for children, music is part of the story and it is consequently subject to the narrative structure, on which it depends. Music interacts with the audience in the construction of the story, the definition of the characters, the settings and ambiances, and the emotional climate. Taking these factors into consideration, the musical characteristics, the impermanence, the relation between the music and the story, and the position in the narrative structure were analyzed as case studies.

Two approaches were employed to answer the two basic research questions of this study: What is listened to? (musical categories), and what is the material listened to like and how is the music built? (content analysis). The checklist specifically designed for this research and discussed earlier was used to answer the first question, and an analysis of 13 musical categories was carried out to establish the characteristics of the soundtrack of the TV programs for children. The research used musical analysis (Zamacois, 1987), the relational timeline for music in the narrative structure, and content analysis of the levels of credibility to answer the second question. This second line of research added an element of greater significance to the descriptive one, since it explored communicative intentions, and the assignment of roles and values by means of the music.

Analysis of TVE Programs for Children

One section of the study explored the soundtrack of *Los Lunnis*, the children's television program with the highest audience figures in Spain. *Los Lunnis* is produced by TVE and broadcast on TVE2 every day from 7.30 to 9.30 a.m. The week's episodes are shown again on Saturday mornings. It is the only children's program offered by TVE and is produced thanks to public funding. *Los Lunnis* is aimed at children between the ages of 3 and 10. The program is also shown in other countries, and is structured as a programming block with cross-curricular educational objectives. Studies indicate that most viewers are between the ages of 4 and 6 and that the music is one of the main reasons children watch the program. *Los Lunnis* has been awarded a number of prizes, and has been praised for promoting positive values and behaviors such as interculturalism, for fostering ethics, for disseminating nonsexist behavior, and for the rational use of television. The sample analyzed here consisted of 10 hours of programming broadcast during a week in which no special events were taking place, namely February 18–22, 2008. The programs were recorded on DVD and the music was analyzed in terms of its narrative and visual context. In the sample, this programming block consisted of both Spanish and US cartoons (20%), advertising

for food/candy and toys (4.4%), and, lastly, in-house program materials, including the opening sequences, closing sequence, bumpers, dramatizations, reports, songs, news, and interviews (75.6%).

To answer the broad question of what is listened to, a number of more specific questions were posed. These included: What musical sounds are used and what types and families do they belong to? What tempo and meter are used? How do the pieces of music begin? What pace and intensity do they have? What genres and styles do they display? What keys are most frequently used? How do the pieces of music end? And how important is the soundtrack in the program as a whole? Here, the program was studied using the checklist developed for this research and validated before applying it to the study (Porta & Ferrández, 2009). Sampling was performed by means of the expert choice procedure so as to include the musical elements from the three sections of the program (in-house programs, cartoons, and advertising) that were relevant to the first analysis. Furthermore, the sample was complemented with 10 periodic cuts selected at random to allow determination of the musical material in the program. The checklist was applied to the program by an expert. It involved the use of 90 units of analysis and a full examination of the musical form consisting of 23 pieces.

Answering the question of what the music is like entailed determining the musical and discursive meaning of these elements, as well as their specific weight in children's programs. In order to do so, the programs were subdivided into three types of program materials: in-house (locally produced) program materials, advertising, and cartoons. Additional questions that were asked included "What are the musical characteristics of the soundtrack and how is it constructed?" A new approach was developed to search for the molar elements (Pozo, 1989, pp. 166–167) and their meaning, namely:

- 1 the internal characteristics of the music from the three sections of the program, that is:
 - (a) in-house program materials: study of the opening theme music, closing themes, bumpers, and songs;
 - (b) cartoons: the series *Berni*, *Clifort*, and *Pocoyó*;
 - (c) advertising: commercials for toys and food/candy;
- 2 The diegetic songs (that is, songs sung by the characters).

In order to study how these were dealt with in the program, five songs performed by the leading characters in the program were selected.

What Is Listened To? Musical Categories

The study demonstrated that the program makes frequent use of both musical and nonmusical sound consisting of noises and sound effects. The music in the sample

consisted of 70% electronic, 15.5% acoustic, and 10% hybrid combinations, mainly groupings of instruments, the majority of which were string instruments. Electronic sounds were predominantly imitation. Forty-two percent of the music was instrumental and the rest was vocal, mainly in groups of voices (38.9%), with a prevalence of male (10%) over female voices (2.2%).

In terms of *meter and rhythm*, the results were binary in 88% of cases versus 1.4% of ternary, with occasional cases of blends. A binary rhythm refers to a rhythm based on one strong and one weak beat (e.g., in a march). A ternary form consists of one strong beat and two weak ones, an example being a waltz. The *type of beginning* analysis revealed that the pieces of music had anacrusic beginnings in 57% of cases versus 37.8% with thetic beginnings. There were also a few cases of acephalous beginnings. Anacrusic beginnings precede the first beat in a bar, while acephalous beginnings start after the first downbeat. Thetic beginnings start on the first beat (see Porta and Ferrández, 2009). The use of intensity (dynamics) was mostly flat (81%), with variations in 18.9% of the melodies. As far as agogic variations (or variations in pace) were concerned, the music in this program was again seen to opt for no variations in tempo in 88.9% of cases versus 3.3% in which it speeded up, and a slightly higher percentage that used *ritardando*.

The most common genres were popular music (77.8% of the total) – pop, rock, blues, and other popular styles and subgenres from the twentieth century. With regard to traditional music, 13.3% came from other cultures, while only 1.1% came from Spain. The sound organization revealed a predominance of the major key (88.9%) over the minor key (6.7%) in the sample. Most of the music resolved in a conclusive manner (56.7%) versus 25.6% for suspensive, and 10% for truncated melodies. This last type of melodies occurred in advertising segments or in adjustments made to the continuity of the program. The analysis of the *sound texture* showed that the most common melodies were songs that are sung by one voice accompanied by instruments (64.4%), in contrast to several voices singing together (17.3%). Finally, the study demonstrated that music often plays a leading role in the program, and appears as background music in scenes and dramatizations in just 25.6% of the cases in the sample studied. Table 24.1 shows the details of the results obtained.

What Is the Music Like?

In order to study the musical characteristics, 23 pieces of music from different sections of the program were analyzed, bearing in mind the length of the work and its musical form. Thus, the first and last phrases, two intermediate cuts, and an evaluation of the whole piece of music were studied in the case of the longest pieces (understood to mean pieces of music lasting more than one minute) over the five days of the week. The results of the analysis of the musical contents of the in-house program material (opening themes, closing music, bumpers, and songs), cartoons, and advertising were as follows.

Table 24.1 The indicators: results by musical categories

Musical sound and instruments		Agogic	
Acoustic		Speeding up	3.3
Chordophone	3.3	Ritardando	4.4
Aerophone	0	No variation	88.9
Membranophone	1.1	ND	2.4
Idiophone	0	Genre and style	
Instrumental group	11.1	Erudite Western	3.3
Electronic		Popular	77.8
Original	4.4	Traditional	
Imitation	65.6	Local	1.1
Combination	10	External	13.3
ND*	4.5	Combinations	1.1
Vocal/instrumental		ND	3.4
Man	10	Sound organization	
Woman	2.2	Major key	88.9
Child	0	Minor key	6.7
Group of voices	38.9	Modal	0
Others	5.6	Others	0
Instrumental	42.2	ND	4.4
ND	6.9	Cadence	
Meter and rhythm		Suspensive	25.6
Binary	88.9	Conclusive	56.7
Ternary	0	Truncated	10
Others	5.6	Others	1.1
ND	10.6	ND	6.6
Type of beginning		Sound texture	
Thetic	37.8	Homophonic	4.4
Anacrusic	57.8	Accompanied monody	64.4
Acephalous	1.1	Polyphonic	12.9
ND	3.3	ND	18.3
Dynamics		Sound plane	
With variation	18.9	Music as leading figure	61.1
No variation	80	Music as background	25.6
ND	1.1	ND	13.3

*ND = Undetermined.

Figure 24.3 Musical structure of the opening sequence

In-House Programs

The opening theme music of the program, which was repeated on each of the five days of the week, was studied using 15 checklists – three for each day. It is a short tune lasting 34 seconds, with an anacrusis beginning, in G major, and a tempo of 144 beats (quarter notes) per minute. It is sung by adult soloists and vocal groups accompanied by instruments (Figure 24.3). This tune is the one that is most frequently used in transitions, to present dramatizations or subsections, and as bumpers and closing themes. For each use, however, it is adapted to create different versions, which may be instrumental, vocal, or semi-spoken, and could be complete, fractioned, or played as a repeating loop.

In the closing themes (i.e. the musical themes that accompany the credits at the end of the show) the program utilized the tune from the opening, although some parts were removed while the motif from the signature tune was kept. These were of varying lengths: 4 seconds, 36 seconds, and 1 minute 33 seconds. For example, this last closing theme, which was the longest of all, was repeated in a loop while the last dramatic action in the program was finishing, and it concluded when the signature tune shifted from the background to the foreground. On two of the five days it was truncated and replaced by the next program. Eight of the bumpers lasted 7 seconds and, again, took up the identifying elements of the opening theme tune and used them with different arrangements and effects.

There were many different songs and melodies in the program. In this subsection the aim was to retrieve those that played a leading role in order to determine the different forms, genres, and styles that were used, how they were linked with the scene and the subject matter, and also to explore the synchrony with the text and the images. The songs and melodies selected were those interpreted by characters in different settings, such as in little theaters, pubs, television studios, or virtual sets. Throughout the week analyzed, the following songs were heard as leading figures with diegetic sound: “Un mundo mejor,” “Oh Lulú, Estoy como un queso,” “Soy rancherito,” and “Que me fallen las palabras” (Table 24.2). A total of 25 units of

Table 24.2 Analysis of the songs performed by characters in the program throughout the week

Song 1 “Un mundo mejor”	
Topic	Peace
Summary	A strophic pop song in G major at 168 beats per minute, sung with a child’s and a man’s voices, accompanied by electronic imitative sound. In the last phrase, fireworks can be heard.
Song 2 “Oh Lulú”	
Topic	The legend of the hero
Summary	A country song with alternating verses and a chorus that is repeated at the end. It is in C major at 114 beats per minute. It is sung by a man’s voice, accompanied by an acoustic banjo, percussion, and polyphonic children’s choir.
Song 3 “Estoy como un queso”	
Topic	Self-image and self-esteem
Summary	A blues song at 136 beats per minute. Alternating verses and chorus. Sung with voice, piano, drums, and male choir that echoes in the chorus.
Song 4 “Soy rancherito”	
Topic	Popular song
Summary	A Mexican-style song in C major at 144 beats per minute, accompanied by mariachis and sung by a male soloist.
Song 5 “Que me fallen las palabras”	
Topic	Words
Summary	A blues song in D minor at 78 beats per minute. Recreation of a blues recital: singer, electric guitar, drums, and projection screens.

analysis were used, five for each song – one for the first and last musical phrase, two intermediate cuts, and one evaluation of the whole piece of music.

Advertising was studied using a single unit of analysis for each commercial or two when there was a notable change in the music. The common features were: duration of 20 seconds; tempo of about 123 beats per minute; instrumental with electronic imitative sound; binary; no variation in the dynamics or in the rhythm; pop and film genre; use of a major key; and the music was background music that sometimes became the leading, foreground figure. In the case of the Polly Pocket Pony commercial, two checklists were applied because of the significant change in its soundtrack (Cut 1: from 1 to 18 seconds; Cut 2: from 18 to 20 seconds) that takes place in order to highlight the slogan.

Cartoons

Lastly, because of their length, the cartoons were studied with a cut every 45 seconds until the whole episode had been covered. The following is a summary of *Berni* and *Pocoyó*.

Berni is a cartoon series from 2006 without dialogue, produced by BRB Internacional S.A. It deals with the subject of sport and features Berni, a polar bear. It consists of 3-minute episodes strung together back to back to fill the total length of the broadcast. Six units of analysis were used to examine the quantitative characteristics of the soundtrack, and a musical study of the cartoons was conducted in order to find out what their music is like. The episode included both everyday noises and sounds, and electronic imitative sounds. It combined the classical style in short sequences with other styles more closely related to the incidental music of movies. The music was written in a major key and was instrumental, with no variation in the rhythm or the dynamics, and both conclusive and suspensive cadences were used. Some modulations to other tones were produced, the sound texture was a single voice accompanied by instruments, and the music appeared as background music, except for just one occasion on which it progressed from the background to the leading figure. *Pocoyó* is a Spanish cartoon series from 2005, produced by Zinkia Entertainment Production S.L., which features Pocoyó, a little boy whose adventures involve exploring and interacting with the world around him. Each episode lasts 6 minutes and 45 seconds and the narrative action in this particular episode was about discovering one's own fingerprints and those of others. It made use of both nonmusical and musical sound from the world of pop, with hints of the incidental music used in movies. The music was electronic, instrumental, binary, and thetic, with variations in the dynamics and the rhythm. The tempo was linked with the characters as they appeared on scene: Pocoyó at 156 beats per minute, Elly (the elephant) at 90, and Pato at 114. Both major and minor keys were used, with different cadences and modulations; the sound texture was the accompanied monody, and there were also rhythmic ostinatos and sound effects. The music was present both in the background and as the leading figure, and the musical motifs were the leitmotifs of the characters.

Analysis of Cinema for Children: *Happy Feet*

Happy Feet is an animated movie released at the end of 2006. It was directed by George Miller, produced by Warner Bros, and won an Oscar and a Golden Globe. It features the voices of Elijah Wood, Robin Williams, Brittany Murphy, Hugo Weaving, Nicole Kidman, and Hugh Jackman. To conduct the study, the entire movie was viewed and its musical numbers were placed on the time frame and matched to the continuity of the story, while looking at the characters, stage space, cultural groups, and so forth. The movie was analyzed by levels of credibility: *nuclear*, *poetic and logical*, and *topical*. Then, a descriptive study of the musical categories was conducted in order to determine the ways rhythm, timbre, texture, and so on were used.

At this level of analysis, the listening checklist system (Porta & Ferrández, 2009) was applied to examine the musical categories and indicators (level 1: nuclear

credibility). The meaning of the music within the movie was also determined using poetic credibility, by studying the different musical segments, their time frame, characters, and the characteristics of genres and musical styles.

The musical numbers from the movie were analyzed, and eight songs and three numbers with choreographed melodies were examined in greater detail. To do so, a table was created for this movie, to represent the four sections of the narrative plot. These four sections were: (1) society of the Emperor penguins; (2) exile and appearance of the Latin penguins; (3) the encounter; and (4) the men. The songs within each section were situated in their time sequence. Lastly, the presence and communicative force of the music in the story was determined by studying the degree to which it was present in the action.

The Story

The movie tells the story of life in a society of Emperor penguins. Three social groups can be distinguished: the Emperor penguins, the Latin penguins, and humans. The members of the first group are the leading characters in the movie. One of its members is born different from the others, and leaves because he cannot sing. Later, however, he comes across a group of Latin penguins who appreciate the one skill he does have: dancing. The three cultural groups (Emperor penguins, Latin penguins, and humans) are present in the movie in unequal proportions, since the first 30 minutes are devoted to the presentation of the Emperor penguins and the lead-up to the different conflicts that arise. The life of the Latin penguins is not so clearly portrayed and less time is devoted to them (16 minutes). However, they are shown as a fun-loving society that solves its problems by consulting the Elder. The third group, the humans, who disrupt the ecosystem, appear toward the end of the movie for just the last 3 minutes, in which everything is resolved with a happy ending.

The Soundtrack in the Story

The movie has five songs in Section 1, none in Section 2, two in Section 3, and one in Section 4 (see Figure 24.4). The cultural dominance of the Emperor penguins prevails throughout the whole movie because it is a more structured and organized society. The most important thing, however, is that the lead character is born in it, feels different and leaves, but wants to go back home. As pointed out above, and as shown in Figure 24.4, the movie has four narrative sections. The first three sections reproduce the narrative organization of the movie *The Lion King*, but are not portrayed with the same persuasive/projective talent (Porta, 1998).

The music creates a conservative, mainstream atmosphere that reflects how well established the home society (Emperor penguins) – the society taken as a reference

Section 1						Section 2			Section 3	Section 4
Society of the Emperor penguins 0:00:00–0:30:50						Exile and appearance of the Latin penguins 0:30:51–0:47:15			The encounter 0:47:16– 1:31:57	The men 1:31:58– 1:34:44
S1	S2	S3	S4	No song	S5	No song			S6 and S7	Last song
Elvis Presley	Choir of white voices	Beach Boys	"Somebody to love"	Choir and orchestra; nonmelodic	Choir and orchestra; choreo- graphy in the sea	Just rhythms: batucada; recited; mambo; rap	Trumpets play; sounds Mexican	Choir and orchestra; nonmelodic	"A mi manera" (My way)	
Diegetic				Nondiegetic		Diegetic	Nondiegetic		Diegetic	Nondiegetic

Figure 24.4 Musical numbers in the four sections of *Happy Feet* (2006)

in the movie – is. From a stylistic point of view, it draws on pop, rock, and some classics with polyphonic White voices in its selection of diegetic music. In the land of the Latin penguins no songs are heard, only Latin rhythms performed on percussion instruments (batucada and mambo). Musically, it is briefer and weaker in terms of variety, quality of performance, and association with the characters.

The nondiegetic music in the movie (that which is not performed by the characters) symbolizes the presence of the narrator in the story. It is acoustic orchestral music, with a predominance of stringed instruments and the presence of trumpets in the climaxes of the plot. In general terms, it is incidental music which describes the action and is not very melodic in nature, except in some of the sequences that have a Latin air to them. This section includes a wonderful choreographic sequence in the sea, which is one of the best numbers in the movie, with orchestral, nondiegetic music featuring the Emperor penguins. Both in terms of its performance and instrumentally speaking, the quality of the music (largely made up of successful well-known songs) is unusually good for a children's movie, and is always associated with the first ethnic group, except for "A mi manera," a Spanish version of "My way." It sums up the cultural wealth of the society that the movie portrays as dominant and mainstream, while the other group is constructed as exotic and funny.

Elements of Musical Language Used in the Movie: Nuclear Credibility

The movie uses electric instruments originally employed in pop and rock, as well as acoustic instruments that are both orchestral (all families) and popular, together with body percussion. There is a predominance of binary stress and the intensity is strong in all the scenes (Porta, 2010).

Ordering of the Musical Elements in the Narrative Sequence: Poetic Credibility

No complete songs are heard, the length of time the songs last varies widely, and the music is organized by blending several melodies – two or three in most cases. They are used both as foreground and as background elements. The genres and styles heard include English, American, and Australian pop/rock, classical, and descriptive cinematographic music. Synchrony between music and image in the movie is good, and all the voiced parts of the songs are performed by the characters themselves. The voices singing the songs are very different from the characters' spoken voices, however, which makes the scenes less convincing, and the accompanying instruments remain in the nondiegetic plane, that is, they are not present in the action.

Evaluation of the Soundtrack of the Film; Study of the Tendencies and Cultural Dominance: Topical Credibility

The soundtrack of Section 1 refers to musical language as one of the values of a cultured and developed society, and covers aspects such as how to create a song, school as a place of learning, and music as cultural heritage and a common asset. Yet, in the realm of the Latin penguins, music is presented as fun and a way of escaping from the problems of a society that lacks resources and is exposed to the attacks of predators.

Conclusions and Discussion

The findings obtained by applying the listening checklist demonstrate that the program *Los Lunnis* has a soundtrack that utilizes musical sound (preferably electronic), which is divided fairly equally into instrumental and vocal music sung by groups of voices. Its music is binary, popular, anacrusic, with flat dynamics and no variations in pace, and the texture is the accompanied monody. It uses the major key with modulations to other keys, resolves by conclusive cadences, and the music is predominantly the leading figure. The program also includes a high percentage of nonmusical sound consisting of noises and sound effects.

A preliminary evaluation of the musical analysis reveals that the diegetic music chosen for the in-house material (25% of the program) is made up of strophic songs with phrases that are eight bars long. They are listened to as whole pieces and resolve in a highly conclusive manner with all the available closing elements, sometimes using both homophony and polyphony. There is a certain lack of rhythmic richness, with a strong presence of binary stress. The intensity has no nuances and is control-

led using a mixing desk, progressing from background to leading figure usually by the use of narrative rather than musical strategies. Music and images are well synchronized in the program, and the instruments and sound objects are matched to its soundtrack and the different scenes in the program. Its tempos range from 78 to 168 beats per minute without any variations in the rhythm, and it uses the keys of C major, G major, D major, and D minor, which sometimes modulate to other keys.

The styles chosen in this case make use of a timbral composition that, although at times excessively electronic, utilizes acoustic elements from the corresponding popular music, as well as harmonic and melodic structures that also reflect it. They are often accompanied by choreographed movements and an appropriate wardrobe and set design. From the point of view of style and how it is linked with identity, the program opts for foreign popular music. Advertising, which takes up 4.4% of the program time, has a soundtrack that averages 123 beats per minute. It is predominantly instrumental, with electronic imitative sounds, and is binary andthetic with no variations in the dynamics or the rhythm. It has no defined style; sometimes uses the movie genre, noises, and nonmusical sounds; and appears in a major key in the form of background music.

Cartoons, which account for 63% of the total program time, use both music and nonmusical sounds and noises to reinforce the dramatic action with the aid of changes in key and tempo, as well as the use of suspensive effects and small leitmotifs to define characters. The results from the study of the program show that the most commonly heard melody is that of its own signature tune, which appears as the introduction and at the end of each section, dramatization, and episode. Truncated pieces of music are also heard, especially in commercials and at the end of episodes. Likewise, another point to be highlighted due to its importance in cartoon programs is the preponderance of nondiegetic music, and of a wide variety of both musical and nonmusical sounds.

Music from before the twentieth century is scarce, with a few exceptions being used in cartoons and parodies in the in-house program material, where some allusions are made to the classical style. The leading songs of that particular week were a *ranchera*, a country song, two blues songs, and a pop song. The sample contains a selection of musical pieces from around the world but, although the program is broadcast nationwide in Spanish and is watched by children in all the different regions of Spain, it does not include any Spanish songs. Children's television programs require contents related to their own identity (De Moragas, 1991), yet what is offered is a multicultural space that has lost its local elements and been filled with exotic material.

The soundtrack of the program includes incidental music linked to the action, which appears in all its sections in the form of tiny fragments of music that remind the child of the world of movies. This is the case of the parody of *Lunicienda*, like that of *Psycho*, or the repeated references to one of the last American heroes: Indiana Jones. In *Pocoyó* there are leitmotifs associated with its characters, tonal and nontonal music, modulations, and variations in the dynamics and rhythm, as well as shifts from

leading figure to background, and vice versa. And all this takes place alongside an expressive and aesthetic dialogue in space and time, which envisions its audience as actively engaged and meaningfully interacting with the television media through the music.

After studying the animated movie we found that the soundtrack of *Happy Feet* makes use of electric instruments originally employed in pop and rock, as well as acoustic instruments that are both orchestral (all families) and popular, together with body percussion. There is a predominance of binary stress and the intensity is strong in all the scenes. The semiotic study indicates that the music has represented the values of a dominant society that has been built by its own efforts and everybody's contribution. It also shows that music has assumed a wide variety of universal styles and timbres as well as famous songs and some classic pieces. All the elements mentioned were associated with the group of Emperor penguins, and the music of Section 2, the exile, is a cultural contribution that strengthens the dominant group in Section 3. Furthermore, it also shows their victory related to the appearance of humans in Section 4, and the defense of the ecosystem. In the movie, the music, which is considered a metaphor of society, shows a dominant group that was identified with pop culture, while including some touches of classical and instrumental choral music and also descriptive music from movies, which has absorbed a part of the foreign culture to strengthen its society and to favor economic and cultural development. The elements described become apparent in the soundtrack through a great number of songs, their quality and variety, and the magnificence of the *mise en scène*.

This study can help inform our understanding of the role of music in media targeted at children by offering food for thought regarding some of the social and educational functions of music in cinema and television. The results of this research can be useful as a guide for viewers, production companies, TV networks, and educators. Moreover, policies aimed at preserving, generating, and maintaining macro- and micro-contexts are necessary so that children's everyday environments are continually adapted to enable them to achieve their highest potential (Porta, 2007). Finally, we believe that the study will be of use in future reconstructions of curricular design.

This chapter has dealt with what children listen to in films and TV programs by applying tools that allow a general objective diagnosis to be performed on the soundtrack, through the use of the checklist, as well as other more specific measures for studying its peculiarities. The aim was to determine the music's effects so that alternatives can be developed for future use in education and audiovisual production. This work has taken a first step along that path by drawing attention to the way music is used in the audiovisual media. Because it is part of the habitat that children employ to construct their inner world, if the music made available to them is poor and biased, their vision of the world will be limited by it.

Likewise, it has observed how the music associated with the characters, values, and roles in a highly emotional and projective language is used to highlight dominant

groups and cultural spaces. With a view to protecting children and fostering their better development, this chapter poses a question for future research: Where exactly are the limits of the responsibility of audiovisual productions targeted at children for the creation of their soundtracks? And a second question derived from it: Is one of the challenges facing education the ability to adapt the systems of musical education so as to develop communication and critical thinking skills? The relationships between music and images and narrative in the media produce effects on children's cognitive, emotional, and social development. This chapter has offered a view of the music that is used and therefore of what can be heard in the samples that were studied. The media are a representation of the world in which the characters, scenes, and cultural groups are endowed with music that underlines their ideological approaches and standpoints. Future research will utilize these findings to develop the study of the explicit and veiled functions of soundtracks, to warn of the effects of the music used in audiovisual products, not only cognitively but also emotionally, socially, and culturally. In addition, we aim to seek alternatives that can be introduced into audiovisual production and curricular design, especially in higher education, so as to be able to study the repercussions of music and point to the need to set up observatories and curricular strategies that take them into account.

Latino Diasporas and the Media

Interdisciplinary Approaches to Understanding Transnationalism and Communication

Jéssica Retis

ABSTRACT

This chapter analyzes the challenges and opportunities encountered when applying a transnationalism approach to the analysis and understanding of international migration contexts. Critical perspectives such as the political economy of the media, cultural studies, urban studies, and media practices in everyday life are useful approaches to incorporate in an interdisciplinary understanding of Latino diasporas and the media. Findings from a variety of research projects on media production, distribution, and consumption indicate that these performances are influenced by diverse variables such as the stage of immigration processes, generational and new technologies gaps, and social environments in the city of origin and destiny. Communication and information practices are transformed and reconstructed in the vicinity of Latino diasporas. The conjunction of quantitative and qualitative methods facilitates a better understanding of these complex social processes.

Two concomitant processes have influenced each other since the second half of the twentieth century. On the one hand, international immigration from Latin America increased in the 1980s and 1990s due to the structural changes brought about by the economic, financial, and social crises that characterized these “lost decades.” On the other hand, the field of communication experienced an increase in the concentration of media ownership, combined with accelerated technological innovation and lower costs of transportation and information and communication services. As a consequence, diasporic contexts were transformed by new spaces of production, distribution, and consumption of mass media and, in the last decade, by new communication technologies. *Territorial immigrants* were transformed into *digital immigrants* in complex and changing processes affecting both Latin Americans living abroad and their family and friends who remain in their place of origin (Retis, 2012).

Analyzing and understanding the communicative practices of Latin American diasporas requires interdisciplinary approaches in order to develop a perspective that is both comprehensive and critical (Retis, 2011). Processes of economic globalization require a rethinking of traditional ways of examining national societies in relationship to network systems (Castells, 2006) that have led to the deterritorialization of social life, transformed its cultural dimensions (Appadurai, 1997; Thompson, 1995), and reconfigured nodes in the form of global cities (Sassen, 2001). In this context, links established *between* and *for* immigration networks outline new diasporic spaces relying on transborder circuits of communication and information (Retis, 2008).

What follows is a reflection on the theoretical approaches and the design of methodologies and processes of fieldwork that allowed me to analyze and understand the media as social actors in the context of the international migration of Latin Americans. I argue that in the study of diasporas and the media it is essential to: (1) understand sociodemographic conditions before analyzing media spaces; (2) understand the economic and political structure of the media before analyzing their discourses on immigration; (3) examine professional routines before analyzing practices in covering diversity issues; and (4) understand cultural and media consumption in countries of origin before analyzing practices in diasporic contexts. In sum, it is indispensable to build interdisciplinary approaches to understand transnational communication practices.

The Transnational Perspective: The Interstices of Thinking “Glocally”

My first attempt at investigating Latin American migration and the media came with the development of my doctoral dissertation. My initial research questions focused on sociodemographic, economic, and political contexts: Who are Latin American immigrants in Spain and why do they come? What kinds of structural conditions may cause the movement of Latin Americans toward Spain? What are

their socioeconomic and political status? Subsequent questions focused on the media context: How are Latin American immigrants represented in the Spanish mainstream press? What economic, social, and political conditions influence mainstream news media discourses on immigration? How might Spanish journalists' perceptions of Latin American immigrants shape these discourses? How might this media agenda influence the perception of Latin American immigrants in Spanish society? How do Latin American immigrants perceive their media coverage? How might media images influence modes of intercultural communication between Spaniards and Latin American immigrants?

The first set of questions is aimed at analyzing and understanding the contemporary history of Latin American immigration in Spain. A review of secondary sources revealed that most available research was conducted from an ethnocentric perspective, according to which processes of migration were conceived as unidirectional, driven by poverty and/or exclusion, and where immigrants were perceived as disconnected from their place of origin. In contrast, critical studies detected unfavorable trends in the ways in which migrants were incorporated into social stratification and political discourse: the concentration of displacements from certain countries as a result of structural relations of dependence, fragile immigrant working conditions, low representation of gender and family contexts and/or youth and children in immigration policies, among others (Colectivo Ioé, 1999a, 1999b, 2001, 2003; Gil, 2006; Gregorio & Ramírez, 2000; Pedone, 2003).

The second set of questions guided the examination of processes of representation of otherness in public discourse. Here, the review of secondary sources revealed that very few studies at the time focused critically on the representation of Latin American immigrants in the Spanish press. Most studies examined the representation of non-European Union immigrants, then primarily identified as coming from Africa, and particularly the Maghreb. This situation led to a comparative perspective on the image of "Latin Americans" and "non-Europeans" or "Africans" or "Muslims" in dominant discourses. It became quickly evident, however, that one could not really analyze "Latin Americans" as a homogeneous group. Demographic sources indicated that Latin Americans came mainly from three countries whose nationals are differentially incorporated into Spanish society. Thus, the situations of Ecuadorian, Colombian, and Argentinean immigrant groups, who all arrived during the late twentieth century and early twenty-first century, was compared (Retis, 2006).

The analysis of social representations was based on elements of sociolinguistics, specifically critical discourse analysis (Van Dijk, 1997). It sought to examine not only the language and its connotations, but also the broader media discourse and trends in news media coverage. The sample included daily news stories published during 2001 and 2002 in the three most important national newspapers in Spain: *El País*, *ABC*, and *El Mundo*. Political economy of media and media sociology approaches helped guide the study's efforts to understand the links between mainstream media discourse and political actors involved in "public debate" (Bañón, 2002) and the

analysis of production routines and filters in news production (Herman & Chomsky, 1988). An examination of business and institutional relations between media and political groups helped identify filters at the macro level. Semi-structured interviews with Spanish journalists covering immigration issues in these three newspapers provided a more micro-level perspective. Finally, focus groups with immigrants from Ecuador, Colombia, and Argentina sought to understand how media images influence forms of intercultural communication, in particular, how immigrants perceive their media representations and how these influence their intercultural relations (Retis, 2006).

Representations of Otherness in News Media Discourse: Latin Americans in Spain

Most of our social and political knowledge and our beliefs about the world emanate from the information we read or hear every day (Van Dijk, 1997). Therefore, at the turn of the century, Latin American immigrants in Spain began to be known more for their presence in mainstream news media than through daily intercultural interactions. Spaniards began to hear about Latin Americans from news and feature stories and from interviews with sources that tended mainly to relate to their presence in social conflict (Retis, 2012). The idea of “Latin American immigrants” in Spain was built collectively, giving the entire group characteristics that did not represent their actual nature, but resulted in a symbolic construction that constituted an “imagined immigrant” (Santamaría, 2002). While Latin American immigration is the result of multiple factors operating at different levels, the crossing or intersection between local and global contexts is rarely acknowledged in the genre of news. A complex and heterogeneous situation is turned into symbolic representations of “them” Latin Americans versus “us” Spaniards (Retis, 2006).

Scholars have demonstrated that trends in the representation of non-EU immigrants in Spain take the form of two conflicting modes: on the one hand, the media discourse induces fear by showing immigrants as a danger or a threat; on the other, it tends to focus on the most dramatic aspects of immigrants’ regrettable situation, their poverty, their difficulties, and so on, which induces an emotional reaction of compassion and pity (Rizo, 2001).

The conceptualization of Latin Americans as foreigners, however, required particular elaboration because the process of exclusion could not be based on language or religion. Social segregation was built in the 1980s by the neologism *sudacas* (a pejorative concept that means “from the South”) to signal alien status (Juliano, 1994). In this sense, cultural proximity does not imply the disappearance but rather the displacement of ethnic boundaries within the social symbolic structure. If linguistic and religious differences do not exist, and if racial differences are not extreme, then other criteria are needed to define *otherness*. My multimethod examination of daily

news stories published in Spain's three national newspapers revealed three trends in the representation of this "new otherness": a compassionate view of Ecuadorians, a frightened approach to Colombians, and a brotherly attitude toward Argentines (Retis, 2006). These trends are further examined below.

Compassionate View of Ecuadorians

In January 2001 an accident that killed 12 broccoli collectors in the rural area of Murcia was covered with an element of surprise when irregularities in the working and living conditions of Ecuadorian immigrants were "discovered" by the Spanish media. The magnitude of the event and its news coverage led to the beginning of a social debate comparable only to two previous historical instances: the assassination of Dominican immigrant Lucrecia Pérez and racist events that involved Moroccan immigrants in El Ejido (Retis, 2006).

The discourse analysis identified five themes: (1) the tragedy of the accident seen as "revealing" many other social problems related to immigration; (2) the surprising discovery of a recent increase in the number of Ecuadorian immigrants; (3) the precarious working conditions of Ecuadorian immigrants in rural areas; (4) the lack of labor inspectors and of temporary labor market regulation; and (5) the corruption of Spanish employers who hire undocumented immigrants as cheap labor.

The analysis of production routines demonstrated that the main sources of news stories were representatives of political parties, members of labor unions, representatives of the machinists' union, national and regional government authorities, local authorities, and members of the church. In contrast, representatives of nongovernmental organizations (NGOs) and immigrants or immigrant associations were almost completely excluded from the press coverage, suggesting an imbalance in access to public discourse. Generally, and although the three newspapers analyzed have different ideological affiliations, the analysis showed striking similarities in their coverage of the event.

An analysis of headlines on the day after the accident illustrates this point: "Twelve Ecuadorians die hit by a train in Lorca" (*ABC*, January 4, 2001); "Twelve Ecuadorians die when hit by a train in Murcia" (*El País*, January 4, 2001); "Twelve Ecuadorians killed when a train crushed the overcrowded van they were traveling in" (*El Mundo*, January 4, 2001). The designations were similar: first, Ecuadorian, highlighting the nationality, the term of the out-group (the *others*); second, the word "immigrants," a designation that came into use in the early 1990s involving a series of symbolic connotations: people who come to live in our country, probably without proper documentation (Martín, 2003). This condition is highlighted in most of the news stories, as exemplified by an *El País* article headlined "Labor Inspectors investigate their working conditions" (*El País*, January 4, 2001). Most news stories highlighted information related to inspection, delving into the local perspective

without extending this discussion to global conditions, and without explaining pull-push factors and labor market conditions to readers (Granados, 2002; Retis, 2006).

The analysis reveals that Ecuadorian immigrants were portrayed as passive actors and exploited “illegal” workers – that is, as violators of the law – highlighting the criterion of national origin as a symbolic border of exclusion. Unions and political parties were represented positively as those who assume the voice of protest against the conditions under which “the others” – immigrants in the “Spanish fields” – work. These immigrants, however, remained unidentified and their statements were not directly quoted. For instance, an article in *El Mundo* pointed to second-hand information gathered from Europa Press to discuss the workers’ legal status: “a compatriot of the deceased, who declined to give his name, said the only [worker] who had regularized his situation was the driver of the van” (January 5, 2001). Ecuadorians were presented as victims of the tragedy, of poor working conditions and exploitation.

One of the most frequently recurring metaphors in the news coverage was the representation of Ecuador as a country battered by economic crisis and corruption – “Ecuador, a country in stampede,” read a headline in *El País* (January 7, 2001). Ecuadorians were presented as fleeing, en masse, in an “avalanche” of the new poor. They were “The twentieth century conquistadores” (*ABC*, January 4, 2001). With statements such as “U.S. is no longer the only Eldorado, Spain is the escape gate for 50,000 people” (*El País*, January 4, 2001) or, “The Ecuadorian ‘desert’: There are places like The Village of Lonely Women, where there are no husbands left because they have migrated in search of fortune. Years ago they emigrated to the US, now the dream destination is Spain” (*El Mundo*, January 7, 2001), Spain was, in turn, repositioned as *Eldorado*, or paradise. It was the new place where people came to seek their fortune.

An Attitude of Fear Toward Colombians

The immigration debate became particularly heated in Spain in 2001 following the approval of a new immigration law that implemented new criteria for quotas and control of immigration flows, which led to the self-seclusion of immigrants in churches as actions of protest, and to accusations on the part of political groups questioning the constitutionality of the law and of policies of control and treatment of immigration. In October 2001, the police department launched Operation Ludeco to fight against crime committed by Colombians and Ecuadorians. This followed a previous operation, Operation Coffee, launched in September in response to the death of four Colombians in Madrid. Scholars have demonstrated that the recurring link between crime and immigration in social debate contributes to a process of criminalization of individuals whose crimes are attributed solely to their immigrant condition (Aierbe, 2002; Wagman, 2002).

The analysis of the news coverage of Colombian immigrants illustrates this metonymic process. Discourse analysis demonstrated that Spanish mainstream media so frequently designated Colombian immigrants as criminals that the adjective “Colombian” eventually became a synonym for the term. An *ABC* report illustrates this trend: “The Police [is] convinced that Colombians’ violence will splatter throughout society” (September 1, 2001). From the entire corpus only a few examples noted that this linkage is not applicable to the entire group of Colombians residing in Spain – or as, *El País* put it, that “Colombians who commit crimes are only a minority” (October 3, 2001).

During the period analyzed, news coverage of Colombians centered on two main topics: drug trafficking – “Network of Colombian ‘narcos’ acting through Internet and paying with emeralds is caught” (*ABC*, May 29, 2001); “Traveling with her three years old daughter transporting camouflaged cocaine” (*ABC*, September 22, 2001) – and robberies and violence – “Firefighters rescue Colombian sequestered for ten days” (*El País*, January 18, 2001); “Spain captures the murderer of eleven Colombians” (*ABC*, May 14, 2001); Hit men and dangerous criminals arrested in a major action against Colombian gangs” (*ABC*, November 25, 2001); “Gang of Colombians who stormed over fifty villas and apartments is dismantled” (*ABC*, June 28, 2001).

This correlation is related to news coverage of Colombia in international news stories where most of the information is linked to guerrillas, crime, corporate corruption, and drug trafficking (Igartúa et al., 2003). These arguments cause fear and rejection of the foreigner who comes to break the law. As Reguillo notes, for governments and international press Colombia has become the metaphor of horror and that means chaos, lawlessness, excessive violence, drug control institutions, in short, “institutional collapse” (Reguillo 2002a, 2002b). During 2001, most of the news stories about Colombians related in some way to social conflict: “Colombian ELN guerrillas kidnapped Latin American motorcycling champion” (*ABC*, January 4, 2001); “Number of paramilitary victims increased. Human rights violations in Colombia, either by the instruments of the state, guerrillas, paramilitaries or drug traffickers, makes this country the worst in the region” (*ABC*, February 27, 2001); “Poor peasants in Colombia give children to tourists to prevent starvation” (*ABC*, January 27, 2001); “Colombia, on the threshold of fear” (*El Mundo*, March 16, 2001).

Brotherly Attitude Toward Argentineans

Discourse analysis of Spanish press conducted during this time period demonstrated a comparatively much broader coverage of the Argentinean financial crisis, with particular attention paid to Spanish investments in the country. Argentineans were represented through a fraternal lens. They were described as “brothers,” “children,” or “grandchildren,” but also as “business partners,” customers, businessmen, and political friends. Three main themes emerged in this discourse. First, the coverage included references to allegations against the Argentine military, to memories of

torture, and to the trials of members of the oppressive government, which resonated with memories of Spain's own oppression suffered in recent history. Second, references to political corruption were found in the opinion pages, but also in news and feature stories. Most of the coverage, however, focused on the third theme, Spain's involvement in the Argentinean financial crisis, with headlines such as: "U.S. accuses former partner of Telefónica Argentina of laundering money" (*El Mundo*, March 1, 2001); "Recol workers occupy the Spanish Embassy in Buenos Aires" (*El Mundo*, March 2, 2001); "Spain caught in financial crisis in Argentina. Investors rely on the South American country despite outbreaks of anti-Spanish demonstrations" (*El País*, June 10, 2001), "The threat of devaluation in Argentina sinks the Spanish stock market" (*El País*, June 19, 2001); "Spain maintains its credit in Argentina. The campaign waged by some unions and media against Spain's image has not resonated with the public" (*El País*, June 24, 2001); "Argentinean workers throw eggs at the headquarters of Telefónica in Buenos Aires" (*El País*, August 6, 2001).

Unlike the news coverage of Ecuadorian and Colombian immigration, more comprehensive reporting on Argentina provided a context for the economic crisis and gave the story prominence in the overall news discourse. As a consequence, emigration was represented as a solution to middle-class struggles: "Getting out of here. The degradation in survival and disenchantment with the government are pushing a new exile in Argentina" (*El País*, March 14, 2001); "All for the Motherland. Four Argentinean Spaniard's descendents explain their reasons for leaving their country and entering the Spanish army" (*El País*, June 17, 2001); "Argentineans line up at the Spanish Embassy to emigrate" (*El País*, June 25, 2001).

This comparative analysis demonstrates that, in stark contrast to the representation of Ecuadorian and Colombian immigrants, Spanish mainstream media represented Argentinean immigrants in a gentle – even warm – tone. The coverage focused on the fact that the middle class was most affected by the Argentinian crisis, but failed to notice that this is also typically the case for other Latin Americans. It was as if Spaniards were welcoming their grandchildren home: "Crisis in Argentina: Implications. Spanish emigrants embark on the *return journey*. The middle class, which provides much of the tax revenue, most affected by the situation" (*ABC*, August 8, 2001, emphasis added). The Argentinean economic crisis was closely followed and moved from the business or economy pages to the front cover and the international section of the newspapers. Feature stories on recent migration to Spain took on a similar tone and reports on the settlement of Argentines in Madrid or Barcelona were routinely covered in a more relaxed and kindly manner than in the cases of Ecuadoreans and Colombians.

Immigrants' Discourses on Their Media Images

Spaniards' perceptions of immigrants are periodically analyzed by monthly *barómetros* (periodic polls) of the Centro de Investigaciones Sociológicas (Center of

Sociological Investigations), but little was known about immigrants' perceptions. This part of the study employed focus group interviews to explore how Latin Americans perceive representations of themselves in the Spanish media. Using sociodemographic statistical data available from the Centro de Investigaciones Sociológicas, six focus groups were formed to build a representative sample of men, women, and younger and older participants. Each session lasted between 40 minutes and an hour. I showed participants a selection of examples of newspaper stories and asked them to express their opinions on media representation and intercultural relations in Spain.

Ecuadorians: "We Are Just the Poor and We Get Angry"

Ecuadorian immigrants expressed anger at the way in which the mainstream Spanish media represent their ethnic group. Most participants summarized this feeling by pointing to the adjective "poor." They noted that the word is used with a double meaning: "poor" from an economic point of view, as belonging to a low-income community, but also "poor" as an emotional perception, suggesting that they are unable to overcome exploitative situations. When reading samples of newspapers, participants discussed how they felt powerless because they were not able to change these perceptions. They took on a vindictive tone in protest against what they saw as an unfair and probably intractable situation. Participants described themselves as hard-working, honest, and decent, but felt they were not represented as such in media reports about them. Their feelings of anxiety about media representations were closely related to the issue of labor exploitation. Participants discussed how they should not be exploited, but recognized that many of their compatriots put up with these abuses for economic reasons. Most participants pointed out that they belonged to the middle class and were neither ignorant nor uneducated:

I want to tell you something very ugly. We are the "poor" Ecuadorians . . . that's what makes you feel more anger and defiance. Because there is when we start with the message that we are not any poor. (Woman, Focus group 2)

Women tended to be more vocal in these discussions. Two main ideas drove their perceptions: on the one hand, when evaluating their situation in the labor market, they understood their contribution to productivity in Spain, especially in domestic service. They felt humiliated and discredited, and noted that neither the government nor other institutions recognized their value. On the other hand, they claimed that the image of Ecuadorian women was linked to prostitution and that this idea did not correspond to reality. When asked about Spain, participants deemed their host society too traditional and nationalistic. They described Spaniards as afraid that immigrants would bring poverty with them, as if they still lived in the postwar period. In the

group discussions, participants acknowledged an increase in “social rejection” in everyday life, which they felt was affected by media perceptions. Participants agreed that there is a clear relation between what people “hear” or what the media “say” and their attitude toward immigrants. They also recognized that the growth of immigrant populations influences the level of rejection on the part of the Spanish population. Most of these perceptions were related to media images and immigrants’ experiences in everyday life – especially when using public transportation and social services, environments in which Spaniards are forced to relate to immigrants.

In terms of access, participants recognized that they have very little opportunity to intervene in media discourse and pointed out that this is one of the reasons why immigration has been unfairly represented in the mainstream press. They felt that the media’s distorted picture of reality was caused mainly by immigrants’ lack of access to public discourse:

We have been manipulated both in print and broadcast media such as television, radio, right? And they [the Spanish media] have tended to talk about immigration from the standpoint of what this lady [another group participant] is addressing, right? . . . We immigrants are entrepreneurs and that has never been sold to the press. (Man, Focus Group 2)

Ecuadorian immigrants recognized that there is a clear illusory correlation between immigration and crime and felt that their group was partially responsible for this perception – although they tended to refer, in this case, to Colombian immigrants. When evaluating what was being said about them in public discourse, Ecuadorians critiqued the over-emphasis on social conflict in news stories – situations of marginalization, overcrowding in apartments, exploitation at work places – and the campaigns against them mainly put in place by police operations aimed at controlling Ecuadorians and Colombians.

Colombians: “They See Us as ‘Bad’ People and They Are Afraid of Us”

When evaluating representations of themselves in the media, Colombians agreed on three adjectives: *sicarios* (assassins), “drug traffickers,” and “guerrilla members.” In addition, most participants recognized that these media images are prominently promoted not only in Spain but also internationally. In discussing their previous experiences in other countries, participants explained that they have faced similar stereotypes. Colombian immigrants discussed the pain they felt when they were not able to overcome this perception at the beginning of their intercultural relations. They felt very much affected by these images in their daily lives, as they tended to be labeled as “bad” before being known. A survey carried out by Aparicio and

Giménez (2003) demonstrated that the media constitute a mirror through which not only Spaniards look at Colombians as criminals, but that also affects Colombians. Participants in our focus groups corroborated the idea that a symbolic border is built around most Colombian immigrants that is hard to escape:

As it affects me a lot . . . and. . . yes, all Colombians. . . Because if we are not guerrilla fighters, we are drug traffickers or assassins. And this is not true because there are also good people who come to work, work normal as anyone else. (Woman, Focus Group 1)

Given these images, Colombians recognized that they have to develop persuasive strategies in their intercultural relations with Spaniards: the objective in their daily practices was to convince the latter that prejudices and stereotypes do not reflect Colombians' real nature. When sharing their personal experiences in their first contacts with natives, Colombians acknowledged that they have to make an effort to show that they do not match the bad media images of them. Participants evaluated these efforts in terms of successes and failures but there was a group consensus that the results were mainly positive: Colombians generally recognized that once Spaniards got to know them personally, these negative media images could be overcome.

Participants claimed that the media – referring specifically to TV and radio, but extrapolating to the news media in general – have produced these images. When criticizing media practices, Colombians characterized the Spanish media as sensationalist, noting that they commonly “sell” specific images for their value in news markets.

There is so much sensationalist media with a simple desire to sell a story, so they give specific names to certain characters from certain nationalities. For example, a robbery will be given prominence all day, but they do not show more important information from that specific country . . . and what has been said in previous campaigns linking immigration with crime . . . that cannot be done. (Man, Focus Group 1)

Argentineans: “If We Do Not Talk, They Do Not Realize We Are Argentineans”

Argentineans acknowledged their preferential status in the Spanish news media coverage of Latin American immigration. They understood that this privileged position is due to their “greater resemblance to Spaniards,” as there is a distinction between different Latino nationalities. Group participants used the term “castes” to refer to what they understood as “levels of acceptance.” In this sort of stratification, Argen-

tineans occupy first rank in social preference because they are “the most Europeans of South America”:

- MAN FOCUS GROUP 1: There are status such as . . . as “castes” [laughs] . . . if we can say so . . . uh . . . fortunately or unfortunately, I do not know . . . eh. . . we Argentines are like the most Europeans of South America . . . and all in all [discussion on negative presence of Latin American immigrants], we remain unnoticed . . .
- WOMAN, FOCUS GROUP 1: Sure, physically . . .

Participants agreed that in their daily intercultural relations, Argentines have more tools at their disposal, such as experience of previous migrations processes between Spain and Argentina, or closer cultural liaisons due to their recent common history. They found that Argentines came equipped with more information about what to expect in Spain than other Latin Americans. They explained that other Latin American immigrants accept certain extreme situations that Argentines would not allow. Younger participants insisted that there is a differentiation by nationality, and perceived more discrimination against Ecuadorians and Colombians. They explained this situation, first, by citing Argentines’ “most European” descent, and, second, by pointing out Latin Americans’ attitude toward Spaniards. Thus, in their opinion, it was logical that Argentines should remain racially and culturally unnoticed in Spain. Argentines felt a kind of familiarity when arriving in Spain; however, they felt uncomfortable when observing racial discrimination that relates to skin color rather than social stratification.

Argentines’ self-identification as “pure white” helped them explain their preferential treatment. They felt comfortably racially integrated, and consequently able to evade Spaniards’ racist attitudes. Family ties, in this sense, occupied a key position in modes of perception of in-group and out-group. The hybrid figure of the “hispanoargentino” (Hispanic Argentinean) eventually emerged in group discussions. Compared to the other two Latino groups examined here, Argentines can be considered to fit in what in Spanish I called *la condicion del No-llos* (a condition between “them” and “us”).

Journalists’ Discourses on the “Problem” of Latin American Immigration in Spain

Critical perspectives on news production have demonstrated that journalists do not merely select and combine information: “rather they can be seen to literally ‘produce’ the news in the context of organizational and other social frameworks” (Tuchman,

1980, 2002). Since little was known about how Spanish journalists produce news on immigration, I conducted in-depth interviews with reporters specializing in this type of coverage for the three newspapers analyzed. The main objective of this part of the study was to understand their perceptions, daily routines, and organizational frameworks (Retis, 2013).

When asked to analyze issues on immigration, Spanish journalists recognized that the phenomenon has occurred intensively and rapidly. A noticeable difference emerged, however, in the way journalists working for different news organizations framed the topic. Those working for conservative newspapers described immigration as an “avalanche” and depicted immigrants as “people who have no resources in their home country.” Interviewees working for progressive newspapers positioned themselves as taking a more critical perspective, arguing that there is a trend to criminalize immigrants in conservative news media. In all cases, immigrants were considered to have arrived in “excessively large numbers” and to need to be “assimilated” in a very short period of time. Spanish journalists relied on the European Union scheme of describing international immigration status using two criteria: administrative and geographical origins. They tended to rely on “legal discourse” when describing foreigners.

When asked to examine the reasons behind immigration in Spain, journalists tended to agree when analyzing economic conditions, even if they differed in their political opinions. They identified poverty as the main cause of immigration, focusing the analysis on *push factors*, without further examining the socioeconomic and political realities of the countries of origin, and without addressing international and geopolitical contexts. When they described the development of immigration flows in Spain, they focused specifically on “cheap labor,” centering their examination on *pull factors*.

Journalists described Spain as “Eldorado,” a land of opportunities and access to a better life. They also noted, however, that immigrants are being misled because “they think they will find jobs and housing immediately.” All interviewees recognized that immigrants face “a lot of exploitation” and a severe “housing problem.” Along with this, they believed that many immigrants hold on to the idea of returning to their home countries. They reiterated, on the one hand, figures from voluntary return projects and, on the other, that immigrants found themselves “disappointed” with what they find upon arrival. In general, distinctions by nationality did not appear until the topic was directly addressed during the interviews (Retis, 2013).

Respondents recognized that immigration is a difficult topic. They noted that when covering other political issues, sources – senators, members of congress, and representatives of various institutions – tend to be more readily accessible. They felt that immigration issues, on the other hand, required greater negotiation between journalists and political sources. Respondents emphasized how much effort it took to get information other than that offered through official channels. They valued statistical reports on the number of residents and governmental surveys positively and acknowledged that they regularly use these studies to produce news stories.

Journalists emphasized how difficult it is to get quotes from immigrants because most of them are reluctant to speak to the media. They believed that this is due to their extreme vulnerability. They noted, for example, that it is very unlikely they would get an immigrant to denounce any kind of labor exploitation or other illegal situation. In addition, journalists explained that, even if they got the interview, it was hard to get a picture because of the fear of reprisals from both those who exploit immigrants and the Spanish authorities:

Usually eh . . . it is not an easy issue, I mean; it is not like politics, right? Where you go to the Congress and all politicians are willing to talk to journalists. Not here. Here, is in reverse, people think it is a complex issue and nobody wants to talk . . . So you always need to work hard to get quotes. (Journalist 2)

In recent years, national and international agreements between professional associations have been developed in an effort to improve news media coverage of ethnic minorities. In addition, newspapers have integrated guidelines into their stylebooks, and ethical codes have been promoted by press associations and NGOs. In practice, however, journalists demonstrated only limited knowledge of these initiatives.

Discourses on Self-Representation: Ethnic Media in Global Cities

The need for better access to media and self-representation was a constant running theme in applied focus group discussions with Latin American immigrants in the Spanish capital. Between 2004 and 2007, an increase in the production, distribution, and consumption of ethnic media in Spanish global cities – such as Madrid and Barcelona – seemed to respond to this necessity. Thus, I developed a new research project in 2008 with the aim of exploring their significance and responding to some preliminary questions: Why was there a “boom” of immigrant-oriented media? Who drove these enterprises? Who were the producers? What kinds of topics did ethnic media cover? What were their main sources of financing? What were the main forms of distribution and consumption? This research project combined, once again, diverse methodologies. It began with a review of quantitative data reports. I then designed a survey that was administered to all ethnic media in Madrid. I also conducted semi-structured interviews with a selection of reporters, editors, broadcasters, sales agents, and specialists in ethnic marketing. Finally, I carried out participatory observation practices in a sample of newsrooms and Latino radio stations.

This research identified four stages in the history of ethnic media in Madrid: (1) emergence of media projects during the mid-1990s; (2) first wave of growth (2000–2003); (3) second wave of growth (2004–2006); (4) strengthening of associative synergies (2007–2008). Findings were published just before the Spanish economic crisis in

2008. Much evidence suggests that we are currently in a new stage of recession, which led to the closure of a great number of these media outlets mainly due to a decrease in advertising revenues. However, a group of immigrant-oriented media continues to circulate in some Spanish global cities such as Madrid and Barcelona. I am currently studying these, and other Spanish-language and Latino-oriented alternative media outlets, in a comparative research project that aims to understand how some have withstood the economic crisis and the transition to new technologies in an era of shrinking newsrooms. This comparative study, entitled “Latino Media in Global Cities: Los Angeles, New York, London, UK, and Madrid,” strives to understand how technology, industrial synergies, and the consolidation of transnational Latino audiences have conditioned media projects being produced in these global cities. I base my research mainly in semi-structured interviews and participatory observation practices in these four cities, which have a high or growing concentration of Latinos (Retis, 2010a).

In 2007 a total of 56 companies were identified in Madrid – all of them with at least one media outlet targeted at immigrant audiences. A few entrepreneurial groups published several headers – Copernal Publishing, for instance, produced 14 different magazines. Other initiatives started up from small business groups, such as Doble Via Comunicaciones (four publications), and Nova Duma SL (three publications). Eight groups edited two publications simultaneously: these include España Exterior SL, Media Press SL, and Mediterránea de Cultura y Medios. Some groups – such as Pueblo Nuevo, Roman in Lume, and Si Se Puede SL – produced both print and broadcast media, although that trend was less widespread.

The study found a wide variety of production, distribution, and consumption of immigrant-oriented media. There were high-quality publications – with regular distribution and well-documented distribution systems – which attracted advertising dollars from large clients. At the other end of the spectrum there were small media outlets with less regular publication frequencies and distribution system. These companies usually attracted ads from small and medium businesses and focused their interest on local issues. Distribution systems varied greatly. Some companies hired third-party services for publications’ placement while others used part of the business group to handle distribution. We even encountered some outlets which did not have a regular distribution and where the director or employees distributed the publications by themselves.

One of the most interesting findings was the role of *locutorios* (call centers) as public spaces of intra-group communications and media consumption. These centers provide spaces in which immigrants interact face to face and through Internet and phone calls with their family members. It is in the context of these transnational practices that immigrants got a hold of magazines or weekly newspapers locally produced for them. The use of computers also facilitates online consumption of media produced in their countries of origin. In my ongoing research I found that more recently, commercial enterprises have been designing specialized delivery

systems on mobile phones and applications that aim to increase immigrants' media consumption.

Survey responses and in-depth interviews with ethnic media editors demonstrated that most producers identify their audiences as mainly immigrants. The mention of specific national groups only came later. Also, there was no great differentiation along generational, gender, occupational, or socioeconomic lines. This is likely because these initiatives are in their early stages, which helps explain why most content is related to immigration in Spain, news from countries of origin, and entertainment.

Cultural and Media Consumption in Diasporic Contexts

In-depth interviews and participatory observation in *locutorios*, ethnic media outlets, ethnic restaurants, parks, and festivals helped me to identify trends in the cultural and media consumption of Latin American immigrants in Spain. In 2012 I started a new research project that aimed at addressing the following questions: What are the main characteristics of Latin American immigrants' cultural and media consumption practices? Are there any differences between cultural and media consumption in rural and urban environments? Do cultural and media consumption practices remain similar or become different in diasporic contexts? This new study employed qualitative methodologies that allowed for an in-depth comparative examination of communication practices among two major Latin American national groups in urban and rural areas: focus groups and semi-structured interviews with Ecuadorian and Colombian immigrants residing in Madrid and Murcia.

International studies on contemporary diasporic media point to selective participation and communication practices (Yúdice, 2009). Comparative analysis helped to clarify the sometimes conflicting strategies being established by diasporic communities in host countries, where interactions aimed at preserving heritage and traditions coexist with those that generate negotiated spaces and others that strengthen resistance. Scholars have demonstrated that these positions are dynamic and exchangeable (Georgiou, 2006). The term "space" is understood here as physical space but also as the imaginary space that generates inter- and intra-ethnic relations (Retis, 2011). The majority of respondents in focus groups and interviews emphasized the importance of environments that foster these modes of coexistence. Cultural and media consumption took place in: (1) the intimacy of a room equipped with a stereo, a TV, a video recorder, and/or a computer; (2) a negotiated common space of consumption, especially in multifamily and/or multigenerational houses; (3) indoor public environments such as libraries, schools, and particularly call centers and/or barber shops and restaurants; or (4) outdoor public environments such as parks and plazas. All these

spaces confirm the diversity of spaces where individual and collective cultural and media consumption coexist and are experienced.

Transnational approaches (Levitt & Glick-Schiller, 2004; Smith & Guarnizo, 1998) allow us to analyze and understand how these practices remain similar or are being transformed in diasporic contexts (Retis, 2011). Scholars of Latin America agree that there have been some attempts to correct the lack of information and studies on cultural/media consumption in the region (Bisbal, 2001; Checa, 2010; Sunkel, 2006). Research has been generated in academic and institutional contexts as well as by the cultural industries. Countries such as Colombia, and also Mexico, Argentina, Chile, Uruguay, and Brazil, have sponsored quantitative research initiatives to study audiences at the national level. In contrast, countries like Ecuador are yet to develop such a research agenda (Basantes & Herrera, 2010; Checa, 2006; Machicado, 2008; Martín Barbero, 2009; Reguillo, 2009; Rincón, Zuluaga, Bonilla, & Cataño, 2010; Rosas, 2002; Sunkel, 2006; Trejo, 2006; Wortman, 2006). There remains a need today for a regional perspective and comparative analysis in the region (Retis, 2012).

Previous studies pointed to the centrality of electronic media consumption, the allocation of media and cultural consumption to the private space, the strong segmentation of high culture consumption, and the generation of interpretive communities of consumers (Martín Barbero, 2006). Latin American researchers acknowledge that civil societies appear less as national, territorial, linguistic, and political communities, and more as groups of people who share reading tastes and reading agreements on certain cultural assets (García Canclini, 2001). The formation of Latin American transnational audiences has been recognized by the cultural industries rather than by local, regional, and international governments (Almanza 2005; Rosas 2002; Sunkel 2006). This suggests that the preliminary findings of surveys and private research have been taken into account in establishing public policies (Retis, 2012).

Qualitative studies highlight the impact of new information technologies and communication in transnational production and consumption circuits. Ecuador, along with Colombia, Bolivia, and Venezuela are among the countries with the lowest Internet penetration in the region, while Argentina, Brazil, Uruguay, and Peru are somewhere in the middle. Because of the centrality of new technologies in transnational families' communication processes, some projects have sought to implement call centers in areas of the greatest emigration flows.

Studies of the cultural and media consumption of Latin American immigrants in Spain (Huertas, 2009; Ramirez, 2006; Retis, 2011; Santamarina, 2007), emphasize several trends: (1) diverse and complex patterns relating to immigrants' place of origin and the form of incorporation they experience in the host society; (2) the incidence of transnational structures, especially in familiar environments, that influence consumption habits; (3) the central role of immigrant social networks established in/from places of origin and host countries.

I argue that it is essential to abandon the category of immigrant as a homogeneous group based on national origins. In-depth interviews and group discussions

reveal that the parameters of collective identity have more to do with transnational family status and immediate social liaisons – friends, relatives – than with national identification. These processes also involve not only generational and gender variables, but also socioeconomic class. In this sense, it is also imperative to take into account that complex identity strategies are marked with ambivalences. In spaces of consumption, the global market pushes in one direction and local proximity pushes the other way. Thus, our analyses should articulate the relationship between society, markets, and media systems (Callejo, 2005).

Ethnocentric approaches tend to analyze media and cultural consumption exclusively as they relate to the condition of immigrant. I argue that we should take into account positions of class and structural stratification when examining sociocultural dynamics. Latin American immigrant groups are heterogeneous and they settle in host societies that draw from a rich hybrid cultural baggage. It is the dialogue with the host society that promotes understanding between cultures, not the creation of social hierarchies of interaction. Little can be done to make progress in this area if paternalistic attitudes or perspectives based on fear remain unchanged in immigration studies (Retis, 2011, 2012).

In half of Latin American households in Spain all members were born abroad. Fewer than half of these households are made up of direct family members. A tenth of Latin Americans live with people from other South American countries, which means that some households are composed of extended families or of different families living under the same roof (Colectivo Ioé & Fernandez, 2008). This context influences individual and collective media/cultural consumption practices. A third of adults under the age of 45 have their children in the countries of origin and more than half of adults have no parents in Spain. As a consequence, transnational families develop new channels of communication: almost all Latin Americans maintain contact with their country of origin – more than half through phone calls once a week and more than a third via email or chat, three-quarters of them on a weekly basis. More than half of Latin Americans send money to their parents, children, or siblings. These remittances are also influencing consumption at the transnational level.

In some cases, the cultural and media consumption of Latin American diasporas parallels that of their countries of origin – especially in relation to music and mass media. In other cases, customs transform to incorporate new elements of the host country. Traditional media prevailed in our informants' consumption patterns. A generation gap, however, is beginning to develop: in-depth interviews and focus groups in Madrid and Murcia pointed to differences between “digital natives” and “digital immigrants.” The younger generations tend to act as interpreters and/or intermediary of digital media practices. As Latin American immigrants in the United States, the digital native generations are quickly incorporated as consumers of new and digital media, coexisting with the migrant generations in the transition and adaptation – sometimes successful, sometimes frustrated – to the use of new information and communication technologies (Retis, 2011, 2012).

Our research found that, as in their home countries, Latin American immigrants in Spain tend to prefer television, even if they spend on average fewer hours per week watching television than Spaniards. We also identified an increase in the consumption of international channels. The most popular networks were (in order of preference) Antena 3, Telecinco, and TVE. TV penetration was slightly higher among Ecuadorians than Colombians. We did not find any differences between urban and rural contexts in TV consumption in terms of hours or preferences. We found, however, that Latin American immigrants tend to listen to more hours of radio and more musical radio than Spaniards. Latino radio stations enjoyed larger penetration in urban than rural areas, but this was mainly due to better access to airwaves. More Ecuadorians than Colombians listened to musical radio but the relationship was reversed in the case of news radio shows. Latin American immigrants preferred free newspapers but read mainstream newspaper when they were able to access them in public spaces, such as cafeterias or bars. Immigrants read – in order of preference – free weekly, daily, and monthly publications, sports, and immigrant-oriented print media. The publications with the most impact included *Latino* and *Sí Se Puede* (Yes You Can). The most widely read monthly publication was *Ocio Latino*, an entertainment magazine.

In a trend also found in their home country, more than half of Latin American immigrants acknowledged never going to the movie theater. My study found that formal and informal circulation channels of film and TV productions in DVD format were established in diasporic contexts. The surveys identified higher mobile phone than telephone or Internet penetration. Only a quarter of immigrants had a computer with network access. However, half of them declared having gone online the day before the survey, which means that the use of call centers continues to be important and/or that Internet access from mobile phones has been increasing. Most of them accessed the Internet mainly to use email, view web pages, chat, or read news from their home countries.

Finally, the study demonstrated that the economic crisis has affected Latin American immigrants' living standards in Spain. In interviews and focus groups, respondents acknowledged having changed their practices and their consumption. In their responses they constantly made comparisons of the situation before and after the crisis. They mentioned reducing visits to restaurants and nightclubs and a greater preference for free or low-cost events. They were more likely to meet at home, in parks, or in public spaces where ethnic products are consumed. These practices continue to be popular for respondents in both urban and rural areas (Retis, 2012).

Latino Diasporas and the Media: Notes for Further Explorations

Over the past three decades Latin American diasporas have been consolidating abroad. In particular, the turn of the century brought new population flows to south

European countries such as Spain, Italy, and Portugal. The current economic crisis in these countries is generating second or third international migratory projects: I have found Ecuadorians and Colombians moving from Madrid to northern European global cities such as London, as well as a return flow to home countries. The current contexts will lead to new transnational trends. However, there are still many gaps in understanding these processes at the local, national, and regional levels (Canales, 2011; Guarnizo, 2008; Retis, 2011, 2012). Research requires interdisciplinary approaches and a more comprehensive understanding of the social stratification and socioeconomic inequalities that transcend the prism of immigration. Private and commercial sectors have recognized the formation and growth of transnational communication practices. This is an area in which public, institutional, and academic research still has far to go.

My studies have examined mainstream media representations of otherness (Retis, 2006, 2013b); immigrant-oriented media production, distribution, and consumption (Retis, 2008, 2010a); and cultural and media consumption in diasporic contexts (Retis, 2011). The growing need for access to new technologies in the forms of communication and exchange in transnational living is one of the main challenges for public and institutional policies. Generational and socioeconomic gaps present challenges for administrations. These gaps, however, also provide a fertile ground for academic research.

The gradual geographic dispersion of Latin Americans in Spain suggests that regional and local administrations may require readjustment. Public discourse on strategies of integration tends to favor the national or regional levels when it is in the arena of local government that diversity strategies are needed. Immigrants who participated in my research demanded changes in the ways in which social and cultural programs, such as festivals or youth activities, were implemented. Most informants, but particularly those living in rural environments, demanded more openness when designing celebrations and events and better promotion of intercultural collective practices.

Latin American diasporas accustomed to processes of hybridization gradually incorporate cultural elements from both home and host societies. A respondent's joke powerfully illustrates this idea. She explained that the Spanish small town of Fuente Tocinos is known as the small (Colombian) town of Fuente Pereira because "everyone Colombian here is from Pereira." In this regard, we call for a better understanding of transnational relations that transcend personal and familiar environments to overlap with community relations. Religious festivals and commemorative celebrations might become a barometer of these processes. Good examples of these are festivals and celebrations that take place every October such as Festival Vivamérica in Madrid, Los Angeles' Latino Heritage month celebrations, and the African American Festival in London's Trafalgar Square.

Analyzing and understanding Latin American diasporic practices poses a number of challenges. Latin Americans have joined the context of international migration as a result of geopolitical positions and the realignment of labor relations beyond their borders. The role of public discourse in understanding the structural and cyclical

nature of diversity is central to this process. Latin America has been growing outside Latin America. In the United States it is expected that by 2050 almost 30% of the population will be "Hispanic" (Passel & Cohn, 2008); thus, transnational relations between the United States and Spain via "Latin American circuits" will become more evident, especially for those who can get residence permits and citizenship. Latin Americans construct diasporic communities, built in imaginary rather than physical space, and cultural and media consumption is a central element in their construction. The evidence of transnational audiences has already been recognized by the market and by private industries, but it remains a challenge for governments, institutions, and political administrations both in countries of origins and in the destinations of current international population flows.

Writing

John Durham Peters

ABSTRACT

The introduction of writing in its diverse forms and practices has had enormous cultural consequences. Although it generally plays a secondary role in media histories, it should be looked upon as the mother of all media. Always material and worldly, writing has assumed many forms. This chapter distinguishes semasiography from logography, notes the distinction between logographic and alphabetic scripts, and argues that phonetic practices exist in logographic scripts, while logographic practices exist in alphabetic scripts. Writing is a power technology; a means of preserving meaning; much more than simply an ancillary device for representing voice or speech; a technique that is both historically material and difficult to master; enormously diverse in its history, practice, and expression; a synthesis of visual and auditory modes of perception and of iconic and symbolic modes of signification; dependent on a complex integration of physical skills, including those of the head and hand; and, as a database manipulating spatial and temporal axes, the primordial medium.

I

Next to the domestication of fire, plants, animals, and of humans themselves, the invention of writing constitutes probably the greatest transformation in human history. Like fire, writing has awesome powers. Its power to preserve meanings makes

The International Encyclopedia of Media Studies: Media Effects/Media Psychology, First Edition.

it explosive and dangerous. Like all other domesticates, writing has never been fully tamed, and can occasionally leap its bounds. (We have all been burned by fine print.) Things put in writing can come back to haunt us – or rescue us. Every document is potentially a “little sorcerer’s apprentice” (Levy, 2001, p. 38). Written words have an oracular quality. They keep on saying the same thing over and over again, as Socrates complained in Plato’s *Phaedrus*. They can determine our fates (“the writing on the wall”) and decide between life and death. “If only not to know how to write,” lamented the conquistador Hernan Cortés, “so as not to have to sign death sentences.” Writing indeed has a long-standing association with death (Ong, 1982, p. 81). Whenever one takes pen in hand, even in the most ordinary situations, one opens unforeseeable chains of events, large or small.

The introduction of the medium of writing in its diverse forms and practices has had enormous cultural consequences. Whatever group has possessed it has invariably outwitted those that did not. Writing is not simply a storage device for speech; it is also a power technology. It is a key part of civilization that goes together with such lasting facts as the division of labor, bureaucracy, and male dominance. (The history of writing is also the history of domination.) Writing enables remote control over people and property but also over time and space. A written contract binds the future; an archive of documents preserves the past; and writing has always been the best means of managing events and inventories at a distance. “Writing is magical, mysterious, aggressive, dangerous, not to be trifled with” (Powell, 2009, p. 11). It exercises remarkable leverage over communication, politics, and history and has exaggerated and amplified effects. We all understand Woody Guthrie’s point that some men will rob you with a six-gun and some with a fountain pen.

Writing’s implications are enormously diverse and impossible to treat fully in the short space of this chapter, which focuses on writing as a medium rather than as an array of practices. To use a distinction that the English term “writing” does not make, this chapter focuses more on *l’écrit* or *Schrift* (noun) than *écrire* or *schreiben* (verb). Despite its world-changing powers, writing has become so integrated into our lives that it can be hard fully to appreciate its historic and lasting importance. Like other givens of our existence such as eating, sleeping, thinking, dreaming, or wanting, writing’s basicness both defies comprehension and invites neglect.

II

To some scholars, writing can seem the stepsister in modern media history. Its thunder was seemingly stolen by new media such as photography, the telegraph, and the phonograph, then by film, radio, and television, and finally by the computer and its digital spawn. Once some form of writing was the only way to store anything for transmission to future generations – whether poetry, law, religion, history,

genealogy, property rights, or even music, dance, and cuisine. (Notation systems – such as musical scores, mathematics, chemical codes, and architectural plans – should be included as kinds of writing.) Incessant scribbling – inscribing, describing, prescribing – was the only bulwark against the mischief that time plays with memory. Of course, the very notion that memory is mischievous retroactively imposes an understanding of writing's capacity to fix texts permanently; an oral culture would never imagine invariant transmission as a desirable norm. Writing is itself the bias through which we read history; our access to the history of writing – and the history of almost anything else – comes from the medium of writing itself.

With the great analog explosion of the nineteenth century, writing's "monopoly" on storage was broken (Kittler, 1999). The new optical, acoustic, and electro-mechanical devices seemingly outdid writing in its historic job of making and sending records. By claiming to trace patterns directly from nature, photographs caught images, phonographs saved sounds, and movie cameras held movements much better than writing ever had, which always abstracted and codified events and sensations into abstract symbols. In sending symbolic cargo remotely, the telegraph and broadcasting outsped the post and other messenger systems. And yet, the nineteenth-century explosion of graphic methods that depict time-critical processes – from scientific instruments that inscribe heart beats and seismic activity to ones that record sounds and images – can be seen as deepening rather than subverting writing techniques. The new methods can be seen, to invoke Kittler again, as inscription systems or "discourse networks" (*Aufschreibesysteme*). The arts and crafts of writing proper did not, of course, sit idly by amid the whirlwind of sped-up pictures and sounds. Experimental texts by modernist authors mimicked the new audiovisual logics, and probably no century ever saw such a proliferation of letters, fonts, and calligraphies as the twentieth. The QWERTY keyboard remains one of the most pervasive communication devices well into its second century. By the early twenty-first century, telephone "texting" reminded us that writing as a medium of communication had never really gone away. Despite prophecies of its extinction, paper continues to be used in massive quantities. Indeed, our digital moment surely boasts the greatest abundance of writing material in all of earth's history. Photography, television, cinema, and video did not simply displace writing: their technologies rested upon its deep logics (inscription, storage, editing, transmission) and their products were full of written materials (labels, captions, subtitles, etc.). It is historically apt that you cannot buy a digital or electronic device without it coming wrapped in a package of paper covered with writing.

Even so, writing still generally plays a secondary role in our media histories and is insufficiently understood as what I will argue it is: the mother of all media. By the time scholars started to imagine a history of communication or media in the mid-twentieth century, writing was often treated as an honored but aging medium compared to the audiovisual sounds and shows of the moment. For Harold Adams Innis, who has as good a claim as anyone to having invented the field of media history, the potential obsolescence of writing actually spoke in its favor. As a diagnostician, he

saw the modern world tilting dangerously in the direction of what he called “space-biased” media that aimed to conquer minds and territories; certainly many of these were derivatives of writing (such as newspapers and popular print media). But writing was also the medium *par excellence* of “time-bias.” That is, writing enabled cultural transmission along the time axis. Just as the telegraph connected two points in space, so writing and other time-biased media could connect two points in time. Writing was the medium of remembrance and communication between past and future. Though his normative ideal was the oral tradition of ancient Greece, Innis thought writing could “reveal darkly” that vital way of life, and thus he prized writing (in some forms) as a counterweight to the spatial imbalance of modern life.

As a historian, Innis put writing at the heart of societal transformations. Each new inscription medium brought accompanying political and economic changes (Innis, 1951). In Egypt the shift from stone to papyrus empowered a new priestly caste and destabilized the grip of kings. In Sumeria the difficulty of writing on wet clay led to the more formal writing practice of cuneiform, giving incentives to abstraction and aiding administrative control over the Fertile Crescent. For the Jews, the divine law preserved as text did battle against the graven images of their idolatrous neighbors: part of their religious identity was a commitment to certain media forms over others. For the Greeks, the rise of alphabetic writing and the triumph of prose over poetry meant the decline of music and tragedy (here Innis follows Nietzsche). The Romans, in turn, managed their empire with roads, troops, and a postal system for transmitting written messages and commands, the *cursus publicus*, later giving way to networks of correspondence among monks, rabbis, and Muslim scholars in the Middle Ages. The printing press starting in the fifteenth century worked all kinds of changes in European and world history, changes still being debated and felt; printing, in various ways, was a *conditio sine qua non* for the Protestant reformation, the rise of modern science, the French and American revolutions, and modern imperialism. For Innis, the story of civilization is largely the unanticipated consequences of changes in word-media, especially writing.

If Innis died too soon, in 1952, to analyze the new audiovisual maelstrom, his Toronto colleague and disciple (of sorts), Marshall McLuhan, jumped in feet first. For McLuhan (1962), the new modes enabled a restorative kind of sensory fusion that writing, more specifically typography, had ruined. (Of course printing is but one branch – a huge one – on the family tree of writing, but to get McLuhan’s arguments we must delve briefly into printing.) With a tone that sometimes verged on the gleeful, McLuhan argued that the social ensemble of the printing press, with its linear, assembly-line logic, was vanishing. Working by analogy from the micro to the macro, from cognition to culture, he argued that typographic reading had regimented the human sensorium into a line-by-line discipline and given birth to a social order – the Gutenberg Galaxy he called it – obsessed by segmentation, causality, and abstraction. McLuhan, though himself a man of letters to the core, saw writing as an endangered species in the new electronic habitat. Audiovisual media such as photography, phonography, and cinematography largely meant the outmoding of writing

and literacy – despite the hidden tribute to writing in many of their names (“-graphy” comes from the Greek word *graphē*, meaning writing). In some of his later books McLuhan engaged in modernist literary experimentation himself, with type sometimes bursting the confines of the line to become image. For him, electronic media beckoned us back into an older mode of being. At the cognitive level, this was synaesthesia, i.e., harmony among the sense organs, in contrast to print culture’s “hypertrophy” of the eye; at the social level, this was “the global village” of a renewed oral culture, in contrast to the lonely crowd of walled-in individuals produced by centuries of book culture. Other thinkers in this intellectual tradition, though differing in detail, likewise tend to praise orality for a special interactivity and vivacity compared to writing. For Walter Ong (1982) and Eric Havelock (1986), for instance, writing can never fully represent the warmth and communal solidarity of the oral word.

This normative preference for orality was hotly contested by Jacques Derrida, surely the most influential philosophical thinker about writing in the last half century. His blockbuster book *Of Grammatology* (1976), first published in French in 1967, argued that Western thought’s view of writing as secondary, as a mere means of recording speech by visible marks, had a number of deleterious effects. Though his arguments could be flamboyant, Derrida was very well informed about the history of writing. He took the term “grammatology” from I. J. Gelb, a University of Chicago Assyriologist whose book *A Study of Writing* (1952) was long regarded as the best theoretical treatment of the history of writing, and which also played a strong underground role in postwar French thought about signs and language (de Moraes Rego, 2006), though it has since been criticized for its teleological narrative and its failure to recognize Mayan glyphs as writing. Derrida’s larger points about history, politics, and ethics – that writing’s downgrading was in league with “the violence of Western metaphysics” and helped to foster the illusory belief that the voice was somehow more revealing of or more “present” to the self’s interior than the text – were grounded in the solid philological truth that no script or writing system in history has ever fully captured the voice and that many writing practices have no clear vocal counterpart. “A purely phonetic writing is impossible and has never finished reducing the nonphonetic” (Derrida, 1976, p. 88). He showed that writing was more than a mere ancilla to speech, more than “the painting of the voice” (Voltaire) or “the art of speaking to the eyes.” Derrida helped a wide range of subsequent thinkers see the artful fertility of writing as a medium in its own right. For him, writing did not pervert the supposed purity of speech; rather, writing intensified and revealed the symbolic structures inherent in language generally. Phonetic writing based on the Greek alphabet is not writing in general; it is a peculiar, historically specific form. “In its obsession with phonetic accuracy, the Greek alphabet was a great anomaly in the history of writing” (Powell, 1997, p. 4). Derrida provides a crucial opening for media theory especially, showing that writing’s distance from speech and presence is a gift, not a curse. Absence is writing’s genius, and all media to one degree or another trade in absence (Winkler, 2008, pp. 235, 237). By criticizing the dream of immediacy, Derrida makes room for the medium of writing and also

invites us to see, more generally, media as variations on writing's logics. Writing can thus be understood as primary rather than derivative in our stock of media forms.

That writing has its own logic apart from its vocal accompaniment can be illustrated by one of Derrida's favorite examples. Consider a riddle: what is shared in common by a birth certificate, a wedding license, a coroner's report, a diploma, a birthday card, a declaration of war, a house sale, a legislative bill, a will, and a death sentence? A signature, of course. This cultural form – somewhere between a word, image, act, and gesture – still rules over life and death in our world. A signature transforms a piece of paper into a legal act (Fraenkel, 1992). Nothing binding can be done without one. Not all cultures, of course, work this way, and the signature has been a device for the systematic exploitation of native peoples who guilelessly signed written "contracts" with Europeans. But there is no vocal speech act that accompanies a signature (Harris, 1995, p. 80). It is a pure act of writing, a kind of legal glue in the world of binding documents without need of vocalization. To perform the concomitant speech act with each signature would require an enormous list: I thee wed, I understand the contract, I authorize withdrawal of \$50, etc. The signature is thus a particular instance of the larger principle, discussed more fully below, that images cannot unambiguously designate linguistic utterances. To say a picture is worth a thousand words may be to praise its eloquence, but it is also to condemn its lack of precision.

Derrida's work was part of a wave of scholarly interest in writing in the last five or so decades. The apparent threat of extinction often reveals outlines sharply – this is the point of Hegel's dictum that "Minerva's owl only takes flight in the gathering dusk" (Innis, 1951, p. 9). Interest in orality seems to have been inspired in part by the massive new voice-based media of the twentieth century such as radio, sound film, and telephony (Havelock, 1986, pp. 30–33), and studies of oral poetry would have been impossible without tape recording (itself a neglected writing medium of sorts). The computer – another kind of reading and writing machine – has also inspired much interest in the philosophy, history, and cultural meaning of writing. Scholars who have tackled the subject include classicists, especially those interested in the rise of the alphabet and the "Homer question" (i.e., who wrote the *Iliad* and *Odyssey*, when and how); ancient historians; linguists and anthropologists interested in non-literate cultures; literary scholars and historians of the book; the occasional computer scientist; and historians of science interested in writing as the first among many forms of epistemic instrumentation. Perhaps most importantly for present purposes, media theorists and historians have embraced writing, partly under the encouragement of poststructuralist thought associated with figures such as Derrida, Foucault, and Lacan, all of whom offer elaborate, sometimes baroque, theories of writing. Especially in German media studies, a vital and fascinating intellectual scene since the 1980s, writing is the starting point for studying media, which are always considered to be "paper machines" of one sort or another, however intense disagreements on other matters may be. This chapter does not review German-language media scholarship in any detail but builds upon its invitation to recognize the historical centrality of

writing in media history. “Traditionally writing was regarded as derivative from oral language, as secondary; with the growing importance of technical storage media it becomes central” (Winkler, 2008, p. 197). New media not only reshape current social practices; they also alter our approach to the past. Our era’s incessant texting, posting, tweeting, blogging, tagging, and clicking on two-dimensional surfaces freshly underscores the world-historical importance of writing.

III

Writing is unquestionably the most “momentous” (Ong, 1982, p. 85) of all *technical* innovations in human history. In contrast to spoken language, which seems “hard wired” and a universal part of the human equipment, writing is a software package that requires installation and constant updates. A toddler with something to say will not ask for pen and paper but will use gesture, facial expression, and the interactive array of oral language. Writing, in contrast, is a difficult, unnatural, and even painful medium, and anyone who teaches university students knows that 15 or 16 years of intense training in the art is often not enough to master it. Speech is a more or less “natural” endowment of all humans; writing is a technical accomplishment that requires a long apprenticeship. (And, unlike writing, almost everybody enjoys talking.) Of course, defining what is “natural” for *homo sapiens* is a highly vexed problem; as Ong (1982) nicely puts it, “artificiality is natural to human beings” (pp. 82–83). Everyone who writes knows that it can be an intensely physical process involving sore backs, bitten fingernails, headaches, and pulled hair. Writing is work. It exacts a fierce bodily and cognitive discipline. It has a crucial biomechanical dimension, requiring integration of multiple skills such as eye tracking, vocalization, auditory perception, manual dexterity, posture, and mental exertion (Liu, 2010).

And writing is always material and worldly. Though speech can have enduring consequences, its medium of record – memory and lived practice – is comparatively ephemeral and immaterial. Writing takes advantage of the conditions and resources available such as stone, clay, bones, shell, silk, bamboo, jade, brass, wood, animal or human skin, papyrus, paper, and silicon chips. Even dust has been a writing material – *abacus* descends from the Hebrew word for dust, which once covered tablets used for figuring. The same is true for oil vapor, the short-lived medium of skywriting. There may be speech without tools or tangible materials, but writing always requires both. The history of writing tools, styles, arts, and practices has become a fascinating scholarly subspecialty of its own. An entire material-cultural infrastructure supports writing, from tables, chairs, lighting, and ink to forestry, paper-milling, education, and optometry. Writing is always material and technical, however automated or naturalized it may feel to its users.

Just what is writing? Writing is not only a difficult practice to master, it is even a harder concept to define. Its practices are so overwhelmingly diverse and technically

complex as to defy a single overarching understanding. As general definitions, Gelb (1952) offers “a system of human intercommunication” (p. 12) or “a device for expressing linguistic elements” (p. 24) both “by means of conventional visible marks.” Powell’s (2009) definition is similar: “a system of markings with a conventional reference that communicate information” (p. 18). For both scholars, whose analysis I follow here, writing must have visual markings and be governed by systematic rules of decoding, but it need not necessarily stand directly for speech, though most forms do. Like Derrida, Gelb and Powell warn against generalizing too glibly from the alphabetic system passed down from the ancient Greeks, in which discrete letters stand more or less exactly for the acoustic elements of words (more exactly, for instance, in Spanish, and less exactly in English). A two-dimensional plane capable of receiving visual-spatial marks also seems definitive for almost all forms of writing. Words used for writing in many languages imply actions such as incising, scratching, or scraping on some surface – the Latin *scribere*, German *schreiben*, and French *écrire* are all cognates to the English *scribble*, and the Greek *graphō* (“I write”) is a cognate to the English *engrave* and the Spanish *grabar* (to record or to tape).

Permanence of record, though essential to writing’s power, is not always a failsafe criterion, given the crucial part played in the history of writing by erasable surfaces such as the wax tablet, the slate, the blotter, correctible typewriters, and the computer screen. The history of the pencil, for instance, shows a vast realm of experimental, erasable, and fruitfully non-durable writing – what Sybille Krämer (2005) calls “operative writing.” First drafts, architectural drawings, mathematical calculations, and engineering plans require disposable, correctable writing. “Ink is the cosmetic that ideas will wear when they go out in public. Graphite is their dirty truth” (Petroski, 1989, p. 6). Not all writing, fortunately, is permanent – the humble pencil eraser is one in a long line of highly useful methods of deletion. Writing entails not only the power to store and transmit meanings, but to process them as well. Like the abacus and tablet, the pencil shows that writing’s revocability is an important counterweight to its finality. Cancellation is a prerogative of power (Vismann, 2008, pp. 25–29). Editing is a sign of majesty. Amnesty has long been figured as the blotting out of a written record. Without deletion, we would always be stuck with Pontius Pilate’s dour decree: “I have written what I have written” (John 19:22). The eraser is a small symbol of forgiveness.

The history of writing is itself full of deletions. The preservation of written records (perhaps like all historical records) often depends on happenstance. Linear B, an ancient script that offered essential clues to the history of ancient Greek, was preserved by a palace fire in Knossos, Crete that baked clay tablets that otherwise would not have endured; Aramaic, the language chosen by King Darius to administer the far-flung Persian empire, is best documented in Egypt, not because Egypt was the geographic center of the language’s use, but because a desert climate preserves documents on papyrus, parchment, leather, even stone or metal (Ostler, 2005, pp. 78, 83, 131). If the overall history of writing is patchy, the history of human communication is even more so. Humans have been writing for over 5,000 years, but they have been drawing and using language to speak for perhaps ten times that long. Sexual

pair-bonding seems to be about 1.7 million years old, and to sustain life-long attachments and cooperative activities, a rich repertoire of non-verbal, that is, meaningful but non-linguistic, signs and gestures must have developed; basic facial expressions of emotion such as fear, joy, and surprise, for instance, seem more or less universal across humans. Much of this history is still unclear but archaeological and genetic evidence offers indirect material for conjectural reconstructions. “Prehistorians,” writes the French paleoanthropologist André Leroi-Gourhan (1993), “must resign themselves to doing without the evidence that would have been most significant – gestures, sounds, arrangements of objects” (p. 107). Writing gives us almost all of what little we have of the long history of communication among humans.

One of the most compelling approaches to the early history of writing comes from Leroi-Gourhan, who is increasingly seen as one of the twentieth century’s great media theorists and exercised an important influence on philosophers of writing such as Derrida. Using a broad comparative evolutionary framework, Leroi-Gourhan argues that writing put language under the control of the hand as well as the face. Before writing, the instruments of language were voice, tongue, and ears, but writing puts the two great centers of human interaction, the face and the hand, on an equal footing. The roots of writing are found in drawing or “graphism,” to use Leroi-Gourhan’s compromise formulation. Cave paintings were, he claims, an accompaniment to an oral context, not an effort at realistic depiction of animals or hunts, and he looked for language-like rhythms and syntax in their design. But drawing and writing, he notes, do not operate according to the same logic. Drawing has a multi-dimensional freedom, while writing is more or less linear, subjugating the image to the rule of phonetic sequence. The admiring eye is free to rove over an image as it wills, but the reading eye must track a text in serial order. The image may have structure, but it does not have syntax. Drawing is figurative, but not linguistic, but it is clearly the primal source from which writing practices emerge.

Gelb gave this historically early stage of writing the rather ungainly name “semasiography” and the label stuck. From Greek terms meaning “the inscription of significance,” semasiography is detached from speech. It communicates a more or less clear meaning via visual representations but without designating an unambiguous vocal or linguistic correlate. Consider, for example, the “not allowed” sign – a red circle with a diagonal slash superimposed on an image of the banned activity in question (Powell, 2009, pp. 19–20). Figure 7.1 shows a sign widely understood by the eye, hugely divergent to the ear: not only could it be translated as variably as *interdit de fumer*, *ikke røyke*, or *μη καπνίζετε*, it could also be stated in one language as variably as *no smoking*, *don’t smoke*, *smoking is not permitted*, etc. Semasiographic signs convey meaning without providing instructions for decoding the underlying language. Like visual art, with which they share a deep tie, such signs do not specify propositional content. A picture of a cat on a mat can never distinguish among crucial shades of meaning that are so easy for language to indicate such as “the cat sits on the mat,” “the cat sat on the mat yesterday,” or “cats should sit on mats” (Gombrich, 1972). Other modes allow for much tighter verbal specification – alphabetic writing allowing us to dictate what words we mean letter by letter, for instance – but semasiography

Figure 7.1

is not a precision instrument for encoding speech. Even though it lacks a feature that we alphabet-users might think essential for writing – exact recreation of discourse – we should not think of semasiography as outmoded. Semasiographic conventions are used mundanely in road signage and do-it-yourself instructions for assembling furniture and electronics, and sublimely in mathematical and musical notation. Nor should we view semasiography as deficient in deep meanings. Images, like music, remain some of the most moving things we know, even if words fail us to say why. One thinks of Felix Mendelssohn's answer to the question of why he wrote songs without words. "What I have to say," he said, "is too precise for words."

The key breakthrough occurred in Mesopotamia around 3400 BCE with the rise of logographic encoding, or word-writing. Goody and Watt (1963) put the innovation well: "The notion of representing a sound by a graphic symbol is itself so stupefying a leap of the imagination that what is remarkable is not so much that it happened relatively late in human history, but rather that it ever happened at all" (p. 315). (Whether the history of writing is a history with a single origin is debated by historians, but it is clear that diverse writing practices have independently found ways to indicate sound; the case of Mayan glyphs would seem to argue for polygenesis.) The key device seems to have been the *rebus*, a picture sign which evokes a sound which then evokes a word. The rebus uses images to call up names which are exact or near homophones of other words. Like all historic modes of writing, the rebus is still in use; it is found in children's picture puzzles, and if we follow Freud, in our dreams as well. (Freud, the amateur Egyptologist, liked to think of dreams as hieroglyphs and himself as their Champollion.) The rebus may seem a roundabout way of representing speech, combining image, sound, homophone, and word, but all writing systems involve complex contrivances to some degree. Uniting diverse sorts of data is fundamental to the work that writing does.

Egyptian and Chinese are two leading examples of logographic writing systems. Since each word in a logographic script has a unique sign, learning to read and write is an enormous investment of time and effort. To read a modern Chinese newspaper, one must know about 3,000 characters. (Chinese is unique in that it is the only major ancient script to have survived to this day – Sumerian cuneiform, the first of all logographic systems, Egyptian hieroglyphs, and Mayan glyphs have all gone extinct.) Historically most priests, scribes, scholars, and bureaucrats have had little incentive to make writing technology more accessible. Barriers to entry, as Innis would remind us, aided monopoly control, and the history of writing is never only a succession of scripts, but a struggle between groups for access to the means of communication. Indeed, many pre-alphabetic scripts are full of maddeningly labyrinthine rules that seem almost intentionally designed to be obscure and difficult. The sociological norm for ancient scripts seems to be what some scholars call “oligoliteracy” – literacy of the few. Modernity had a very different vision of literacy as a requisite for all citizens.

Logographic practices are by no means dead. We still use logograms such as \$, £, €, ©, Σ, √, ∞, †, ♥, 1, 2, 3, 4, or 5, etc. (The letters of the alphabet can be used as logograms for some purposes as well.) Logograms may have an implied sound, but phonetic rendering is often open-ended. Though speakers of mutually unintelligible languages such as Mandarin, Min, Cantonese, Shanghainese, and Hunanese can't understand each other's speech, they can read the same Chinese characters. (This fact gives rise to the false idea that Chinese characters are purely ideational and without phonetic instructions.) We can read “Rx” as “prescription” or “are ex” and it won't matter. The meaning of “I ♥ NY” is clear whether one says “I love New York” or “I heart New York.” If I write the sign “1” a majority of earthlings will know what it means but not agree on how it should be read aloud; different speakers may say “one,” “eins,” “satu,” or “yksi.” But additional signs can clarify pronunciation: “1st” = first, “1^o” = primero (Spanish), and “1^{er}” = premier (French). The meaning remains clear to the eye, but the additional sign hints the sound to the voice and ear. (The additional sign complementing a logogram is often called a “determinative.”) This ability to imply the sounds of language distinguishes logography from semasiography. All scripts give indications as to both meaning and sound; there is no such thing as a script that is nothing but sounds or nothing but meanings (Coulmas, 2003, p. 18).

Thus we should not think that logographic scripts do not provide phonetic instructions. Both Chinese and Egyptian hieroglyphs are phoneticized logographic systems. The great majority of Chinese characters are compounds of radicals that indicate both meaning and sound. Figuring out that Egyptian hieroglyphs were full of phonetic indications – in contrast to the old romance of a purely visual language – was the key step for Champollion's decipherment of the Rosetta Stone in the 1820s. (Chinese and Egyptian have been subject to a long history of fantasy projections by European thinkers – Chinese as a purely ideational language and Egyptian as sensuous and allegorical [Derrida, 1976, pp. 76–81]). The combination of signs that

represent concepts and signs that represent sounds is not foreign to English. The cross, a very well-known logogram in English, can be spun in many different phonetic and semantic directions: “†s” = cross and “†d” = dead (Gelb, 1952, p. 118); “xmas” = Christmas and “xing” = crossing. “Twenty” was the name of a British spy ring, since that number in Roman numerals is a “double-cross”: XX. Such far-fetched ingenuity is found in writing both ancient and modern. Medieval heraldry compressed names into designs on shields. Voltaire supposedly responded to a dinner invitation with the message “Ga.” That is, “Gé grand A petit” (big G, little A), or “j’ai grand appétit” (I am very hungry). Today one must read logographically to make sense of phenomena as diverse as vanity license plates and hip hop names and titles. Telephone texting also reactivates ancient logographic strategies (Crystal, 2009): “l8r” in English means “later”; “7ac” in French means “c’est assez” (that’s enough) and “je x” means “je crois” (“I believe” – “croix,” cross, is a homophone with “crois”); in Spanish “s3” yields “es” (S) plus “tres” (three) or “estrés” (stress). To make sense of a text message, you have to know which letters and numbers should be read as logograms with a distinct name rather than as phonetic markers. “7ac” is not read as “set-ack”; rather, the “a” and “c” are treated as logograms with a distinct name and sound. The “l” and “r” in “l8r” work alphabetically as phonemic elements, while the “8” is to be pronounced as a free-standing logogram. Deciphering text messages can be quite a jumble for the non-initiate who is not privy to the code – very much the status quo in the history of writing.

It is thus an alphabetic prejudice to think that alphabets are the only writing systems that instruct the reader in how the underlying speech sounds. Before the alphabet, Sumerian cuneiform, Chinese and Egyptian, and proto-alphabetic syllabaries (such as Aramaic and Hebrew) were able to suggest the sounds of speech. Sound encoding has been a feature of writing since the discovery of the “phonetic principle” (Gelb, 1952, p. 67ff.) in the fourth millennium BCE in the Fertile Crescent, even if rules for sounding out were obscure and not always reliable. By any standard the alphabet was a huge transformation, but it is difficult to get an adequate fix on its historic significance, since there is so much accompanying ideological freight, claims about writing history being mixed up with claims about cultural superiority. For Powell (2002, p. 120), the writing of vowels does nothing less than demarcate the historic divide between East and West, a view enthusiastically seconded by Kittler (2006). Havelock (1986) clearly sees Greek writing, and therefore culture, as superior to Hebrew, a valuation Derrida contests.

The invention of “a short atomic table learnable in childhood” (Havelock, 1986, p. 9) did have all kinds of consequences, but it is easy to miss the continuities with earlier graphic systems for representing speech. For Gelb (1952), the “greatness of the Greek innovation lies [...] not in the invention of a new method of indicating vowels but in a methodical application of a device which the early Semites used only in an irregular and sporadic fashion” (p. 182). (Several Hebrew letters can do double duty as vowel and consonant – *alef*, *he*, *vav*, and *yod*.) As we have seen, the Greek alphabet was not the first writing method to record the sounds of speech in a deco-

dable form; it was, rather, the first to represent speech by nothing but signs for the phonemes of the voice – and thus in a form relatively accessible to all. Only a competent speaker of Egyptian or Hebrew could read those scripts aloud: the visual marks yielded sounds only if you could divine what the underlying words were. With the Greek (vowel) alphabet, a reader could figure out the sounds without knowing the language. The ambition of the Greek alphabet – never perfectly realized – was to provide unambiguous codes of sound to the eyes, that is, to create a one-to-one correspondence of grapheme and phoneme. Despite what some of its devotees such as Havelock (1986, pp. 59–61) seem to claim, the Greek alphabet was no tape recorder capturing vocal sounds in all their particularity. It didn't represent prosody, pitch, pacing, or the infinite variety of tone-color. It represented phonetics graphically, in a brilliant, innovative, and enduring way, but it did not create an exact medium for sound production. There are near-infinite shadings of how to pronounce any given vowel but the alphabet crunches them all into one sign. No writing system is ever purely phonetic – and we should be grateful for the alphabet's astonishing data reduction. This abstraction is not a loss of, say, the fullness of the voice; it is a service. Backgrounding the voice is writing's gift.

The history of scripts resembles more a punctuated equilibrium – sudden lurches of innovation followed by long plateaus of use – than an ever-progressive spiral. The principles that govern alphabetic writing today are essentially the same as those laid down by the invention of the “vowel-alphabet” (as German scholars call it) somewhere in Greece about 800 years BCE. But some alphabetically written languages such as English are rather far removed from systematic vocal representation. “Ghotiugh” can famously be pronounced as *fish*, taking the “gh” as in *rough*, “o” as in *women*, “ti” as in *nation*, and “ugh” as in *bough* (Gelb, 1952, p. 225). English arguably even has some features of syllabic writing systems such as Arabic or Hebrew (in which vowels are implied) or Japanese hiragana (which indicate sounds through fixed syllables). The same “sh” sound in the English words *suspicion*, *shut*, *sure*, *station*, *crustacean*, *session*, for instance, can only be recognized in context; this is no atomic table where each free-standing letter possesses a unique sound but a much more volatile and interactive chemistry!

The written form of a language can contain intelligence that its spoken version does not. This is true of both English and Chinese, though much more intensely in the latter's case (Powell, 2009, p. 48). Anciently, many Mandarin words were phonetically more differentiated, but many have since merged in pronunciation, leaving the language with many monosyllabic homophones that stand for distinct characters. This leads to a situation in which a single story of 92 characters about a poet who eats lions can make perfect sense to the eye but, when read aloud, consists of nothing but variations on the single syllable “shih” (Fallows, 2010, pp. 39–43). Here the written form takes authority over the spoken. The visual or mental “reading” of Chinese ideograms disambiguates homophones more quickly than speech, and though Chinese speakers usually rely on syntactic context to specify the implied character, they will sometimes draw the character in the air or on paper in line with

Chinese's important manual-graphic dimension (Liu, 2010). In English, the priority of the written form is weaker but still evident. English's erratic spelling, though often a target for reformers, holds firm because it is a treasure-trove of the language's history, and even more, an indicator of the identity of words. In English, word differentiation depends on the graphic sign: such terms as *but* and *butt*, *threw* and *through*, *sight*, *site*, and *cite*, are phonetically identical. Context normally distinguishes them, but recourse to the written form, either as seen or spelled, decisively clarifies which word is meant. The written form – here is the point Derrida would underscore – is the decisive way to tell “but” and “butt” apart. (The very ideas of an isolated word and of spelling are derivative of specific writing technologies.) Writing as much as speech defines the word.

In studying writing, we come face-to-face with the bigger mystery of how signs mean at all. We may find it odd or amusing that a single sound in Chinese can stand for many characters, but the principle of one sign/many senses is found in every language. How one sign can mean many things is one of the greatest questions. In Latin “malo malo malo malo” can mean “I’d rather be in an apple tree than a bad man in trouble” if you know which underlying word and syntactic structure to associate with which “malo.” Here we see that the problem of decoding writing is at an abstract level the same as the problem of understanding language in general. If you hear “shih” you have to figure out which Chinese characters are intended, and if you hear “malo” which Latin semantic and syntactic structures, but in both cases the cognitive task is to discern the appropriate rules for generating sense from minimal signs and the appropriate cabinets to unlock. The interpretive task of discovering meanings is similar for talk and text, however diverse specific practices in different languages and scripts may be. Writing is not a betrayal of speech but its intensification. Like language itself, writing is a tangle of accumulated tricks, rules, and habits for leaping over signs on the way to meanings. (It is amazing that we don’t trip more often.) We humans have barely begun to understand how writing works.

IV

The marvel of writing is its union, through a variety of methods, of two very different sensory registers – the predominantly spatial order of vision and the predominantly temporal order of hearing. Visual perception tends to be all-at-once (synchronic) and auditory perception tends to be one-thing-after-another (diachronic). The eyes are particularly apt at seeing resemblances while the ears hear things whose sources we have had to learn to identify by experience. When we hear a sound, we instinctively turn to see its source. But when we see an object, we don’t instinctively ask what it sounds like. The production of sound effects in radio and cinema depends upon the fact that decontextualized sounds, no matter how familiar they may be in everyday life, are often not recognized without an accompanying visual (or other

orienting) stimulus. The two most dominant human sense organs, then, perceive the world in strikingly different ways (Schafer, 1994). The eyes are high bandwidth devices that take in whole fields at once but are indiscriminate in small intervals of time (another key fact for cinema). The ears, in contrast, are lower bandwidth organs that are far more temporally acute than the eyes but less able to identify *Gestalten*. And ears are also the primordial sense for conventionally based meanings – that is to say, for language, the chief of all “symbols,” i.e., signs based on convention rather than nature. Seeing, in other words, rests largely on an “iconic” relation to the world, to use the terms of Charles Sanders Peirce. Hearing, in contrast, is basically “symbolic” in that it grasps the world through habit or convention.

The great breakthrough of writing, according to Robertson (2004), whose theses I sketched in the previous paragraph, was to combine the two sensory registers of seeing and hearing in visual-graphic depictions of linguistic-acoustic signs. “Writing includes both the holistic characteristics of visual perception, and at the same time, without contradiction, the sequential character of auditory perception. It is at once atemporal and temporal, iconic and symbolic. In short, the potential for writing is at the nexus linking the visual and the auditory channels of perception” (p. 19). Writing teaches the eye to behave like an ear, as McLuhan liked to say. In reading, the eye moves serially from one sign to another, not looking holistically for the likeness of things but rather “listening” for the sounds or words indicated by the conventionalized shapes. In order to read, the eye must become a serial processor and follow the discipline of the line. Writing gives auditory objects (words, speech) a visual habitation and temporal events a spatial home. Somehow writing was able to transpose speech’s semiotic structure to a visual plane. In this sense, writing combines at once art and music, sight and sound (Krämer, 2005, p. 76). No purely acoustic object ever endures. In the millennia of prehistory, spoken words lived on after their utterance only in the evanescent media of sound, memory, and collective linguistic competence. Trapping Homer’s “winged words,” writing discovered how to make them last. It was a kind of phonograph long before Edison, sound caught in space. (Linguists even use the term “phonographic” for writing that provides more precise recipes for vocalizing sounds.) The eye learned to process language. This “verbivocovisual” (James Joyce) achievement represents the great sensory–cognitive synthesis of human history.

Writing converts space and vision into time and sound, and time and sound into space and vision. It stands at the switch point of time and space, vision and hearing, face and hand, fixity and fluidity. In this it is the most fundamental medium of communication. Media are apparatuses that translate meaning across space and time, through visual, auditory, verbal, and manual registers, and writing was the first great medium to do so. All media of recording, transmission, and processing since follow in its wake. Quevedo, the great Spanish poet, wrote that in reading, “escucho con mis ojos a los muertos [I listen with my eyes to the dead].” In this he spelled out the domain of media theory, the general study of how we swing across the abysses of time and space, sight and sound, life and death.

V

There is much to be said – and much that has been said – about writing and its history. As noted, such a history would have to be self-reflexive, inasmuch as it would be a history of history itself. And there are so many things such a macro history should treat. We could discuss the history, for instance, of the traditional gender division of labor of text and textile, of the prestige and beauty of calligraphy in Chinese bureaucracy or Islamic religion, of writing implements such as chisel and calamus, quill and typewriter, of the Jewish scroll and the Christian codex, of the printing press and its shaping of national languages and identities, of double-entry bookkeeping and early modern capitalism, of paper's role in money and mathematics, of writing's religious role as scripture and guardian of memory or its epistemic role as database of learning or its use as a tool of subjugating non-literate peoples, of literature in all its varieties, of archives stretching from the library of Alexandria to Google, of memory, of literacy and the rise of the modern self or modern novel, or of the discipline of eye, ear, throat, hand, spine, and even *derrière* in writing. (*Sitzfleisch*, as it is sometimes known, is a key part of the writer's toolkit.) The history of reading has become a vital and exciting research area. Despite so many delicious potential topics, this chapter revisits its central point – the centrality of writing to any possible media history – via a new angle: the power of non-linearity.

McLuhan, like many others, thought writing essentially linear. No doubt, this is to some degree true, as we have seen. The arrangement of signs into rows that must be grasped ordinally is a key differentiation of writing from drawing, of text from image. When one reads a novel, for instance, one typically reads in a straight line from the front to the back page. But linearity is only one side of writing and emphasizing it misses what is most important about writing as a media form: the temporal reversibility that its spatialization makes possible (Winkler, 2009).

Let me explain. According to Schmandt-Besserat (1996), the earliest kinds of writing were tallies and lists consisting of markings on clay shapes she calls “tokens.” These were forerunners of the Sumerian cuneiform writing that lasted for over 3,000 years and recorded many diverse and unrelated languages (rather in the same way that English, Finnish, Guaraní, and Turkish – none of them kin – are all now written with Roman letters). Tokens were used to manage people and inventory. Their function was counting and accounting; they were data-processing devices with no concern (or ability) at first to record syntax or designate sounds relevant to the ear, let alone to chronicle myths or histories. Writing was a tool of computation well before it was a storage device for literature (Vismann, 2008). It has long been used for lists, registers, rosters, censuses, charts, and maps. Siegert (2003, p. 33) notes two traditions of writing: one, working in time, whose task is to capture language, and another, working in space, whose task is to diagram data about collections, inventories, populations, etc. Though he is interested in the encyclopedia and a variety of non-linear literary genres, McLuhan (1962) tends to slight database uses of writing. Since

Gutenberg, books have never been the main item produced by the printing press – bills, magazines, newspapers, and posters have used up more wood pulp than books, to say nothing of its use in packaging. And in the most popular bound formats of print culture, such as almanacs, Bibles, cookbooks, dictionaries, and encyclopedias, readers have always hop-scotched around in the text according to their needs. No one reads every word of a newspaper or legal code from cover to cover. The novel is an exception in the history of printing and reading. Writing does not consist essentially of integrated storylines: stories are one of the many kinds of data it holds. The historiography of writing has been biased toward literature and away from bureaucracy, toward pens and away from pencils. The pretty superstructure draws attention away from the material infrastructure. Above all, writing has been a device for storing and processing data in many forms.

In database uses of writing, spatial location is crucial. In a purely linear text, the spatial location of content is not important. Different editions of the same novel or play could generally have different pagination without anything important being lost. But in an equation, map, or table, spatial location is crucial. Where a decimal point or zero is placed can change the world forever. Krämer (2005) contrasts “operative” from speech-rendering forms of writing. Writing is different from graphic art in that its spaces and gaps can be significant. Focusing on the early modern era, she notes the twinning of paper-based visual and quantitative techniques. Cartesian coordinates, for instance, are possible only on a flat surface: thus paper serves as what she calls “a symbolic machine” or an exteriorized mental tool. Without writing, there is no calculus. For Krämer, writing is not just a storehouse of speech, it is also a technical device of calculation, especially after the arrival in Europe of Hindu-Arabic numerals and the zero. Without operative writing, there is no zero and no decimal point, two devices essential for managing the modern world (finance as we know it could not exist without either). A page can sustain a place-value logic, which is essential for notation systems such as mathematics, maps, and musical scores. Graph paper and lined paper represent diverse kinds of writing practice. Mathematics depends on the “flat laboratory” of writing, and in ancient Greek mathematics, lettered diagrams “acted, effectively, as a substitute for ontology” (Latour, 2008, p. 457). Latour puts it well: media, especially writing, have long been substitutes for ontology.

Manovich’s (2001) perhaps too dramatic claim that recent digital media shift the leading logic of media from the “narrative” form of novels and cinema to the “database” form of digital forms misses the fact that stories and lists, with their respective preferences for temporal and spatial order, have always been competing and complementary principles in the history of recording media (Stallybrass, 2007, p. 1586). Through accounts, ledgers, maps, logs, registers, catalogs, indices, lists, blueprints, schematics, and tables (such as times tables or the periodic table), writing simulates inventories of objects without a front-to-back narrative structure. The beauty of such writing is that its “visual, spatial location” makes it “subject to possible rearrangement” (Goody, 1977, p. 104). Play, possibility, reversibility are the mark of writing

(Winkler, 2009). And even in everyday reading, there is no such thing as a purely linear text – the footnote and the marginal comment both invite the eye to jump off the line. In most writing systems the spatial order of graphic signs does roughly correspond to the temporal order of spoken signs, but not always. “\$100” we read as “one hundred dollars,” such that oral speech reverses the order of the written signs. In arithmetic, we work from right to left in contrast to the left-to-right reading norm, a sign of the differentiation of letters and numbers (McLuhan, 1962, p. 181); this fact can be seen in a digital (base two) notation such as 01000000 (64), which slows down the eye and makes us read from right to left. The diverse routing of the eye can likewise be noted in Hebrew, which reads words right-to-left, and numbers left-to-right. Even at the most minimal syntactic level, the text is not purely linear, and for larger units of text, anyone who reads knows how choppy we enter and exit the world of any book.

The tendency in orality and literacy studies to lament the rigidity of the written word is thus one-sided. Take, almost at random, some lines from Havelock (1986): “Once inscribed, the words in a document become fixed, and the order they appear in is fixed. All the spontaneity, mobility, improvisation, the quick responsiveness of spoken speech vanishes” (p. 70). He gets this exactly backward. Oral speech is linear too. In writing or reading, you can move backwards, delete, skim, and reread (and skip pages if you have a codex). To be fair, Havelock readily acknowledges the great advantages of textual fixity; and live interaction can allow for quick correction of misunderstanding. But the world of writing affords a non-linear editing that is the envy of anyone who’s ever said something aloud that they desperately wish they could retract – as the words hang in the air seemingly forever, burning their imprint on the memories of offended others. In orality, the first draft is usually the final draft, but writing is both permanence and change. The fundamental fact in human life is the one-way flow of time. None of us can turn back the clock, no matter how hard we wish. But writing, by spatializing data, makes it possible to play with the time-axis. We can read backwards or forwards. We can jump from page 1 to page 271 or vice versa in a codex or from one spot of a scroll to another. Writing uses space to manipulate time. The symbolic realm is not subject to the thermodynamic drag of time. Writing was humanity’s first technical means of reversing the flow of time, and its first technique of time-axis manipulation (Krämer, 2006; Winkler, 2009).

I have argued that writing is a power technology; a means of preserving meaning; much more than simply an ancillary device for representing voice or speech; a technique that is both historically material and difficult to master; enormously diverse in its history, practice, and expression; a synthesis of visual and auditory modes of perception and of iconic and symbolic modes of signification; dependent on a complex integration of physical skills, including those of the head and hand; and, as a database manipulating spatial and temporal axes, the primordial medium. Writing is a technical means of using the eyes and hands to speak and hear across distances, of processing complex and massive arrays of data, of transforming space into time and time into space, and of giving us access to a realm beyond the sentence of

time's irreversible flow. Writing may seal our fate forever, but it also gives us a shield against time's arrow. What a strange practice! The literate spend hours immobilized with their texts, ignoring others and the immediate sensory world, subjecting their heart's desires to mysterious logics that come from afar. Signatures and decimal points send some to their deaths and make others enormously rich. Writing creates this strange alternate universe parallel to, and in some ways more real than, our own. Writing is indeed the *pharmakon* as Plato had Socrates call it, the cure and poison at once.

Blogging the Third Wave?

Citizens' Media, Intimate Citizenship, and Everyday Life

Jenny Gunnarsson Payne

ABSTRACT

This essay seeks to address whether blogging can serve as a feminist tool, particularly as a form of practicing citizenship. More specifically, it asks whether feminist blogging contributes only to individualized forms of expression (based on the empowerment of single individuals) or whether blogging has a role in both the construction and endurance of collectivist forms of feminist politics. This essay begins by situating feminist blogging in a larger historical context of media production in the feminist movement. It then presents three different feminist blog projects in order to investigate the various ways in which these blogs practice what in recent literature is discussed in terms of “intimate citizenship.”

Is the blog a tool for young girls to take over an increasing part of public space? Is there a democratic and feminist potential in the increasing blogging phenomenon, or are blogs just another forum where young girls show themselves and others by way of a narrow representation of The Perfect Girl? What does girls' domination of the blog world tell us about our society – and what type of reactions do they provoke?¹
(<http://www.hogkvarteret.se/>)

The questions raised in the epigraph above were circulated as publicity for a panel debate entitled “The Blog – Young Girls' Way to Power?” that was held in April 2010

The International Encyclopedia of Media Studies: Media Effects/Media Psychology, First Edition.

at the queer feminist club Högkvarteret in Stockholm, the capital of Sweden. The issues proposed for the public debate are of a piece with a broader tendency in recent scholarship that investigates the vast increase in female and feminist blogging activity. Generally, it has been argued that the activity of blogging possesses some inherently feminist qualities. Together with other forms of “cyberfeminist” practices, it has been said of blogs that they have the potential to cross boundaries – not only between nations and cultures, but also across the divisions separating the public from the private spheres, the institutional from the personal domains, civil from commercial society. When integrated in the everyday lives of still mainly young (and most often female) feminists, they offer a relatively accessible way of turning “the personal political” (Beetham & Valenti, 2007, pp. 2–3).

The most common type of blog – the diary-like “life log” – has been described as “a remarkable intersection between the traditionally feminine act of diary writing and the traditionally masculine environment of Information Communication Technologies,” or even as an “emasculatation” or a “re-gendering” of this domain (Doorn, van Zoonen, & Wyatt, 2007, p. 147). Yet others have dismissed blogs as a vehicle for feminist politics on the grounds that they offer little more than individualized forms of expression, failing to provide a sustainable form of movement media. Quoted in the British *Guardian* newspaper, sociologist Nina Wakeford expresses apprehension about the place of blogs in the feminist movement. While she concedes that blogs might be useful as a tool to spark debates, she further claims that their function in activism harbors obscurity:

In the past, there was a clear role for women’s organizations as regards representations to government, but I’m not sure whether women can affect public policy through blogging. Just who are they representing? (Cochrane, 2006)

Notably, the apparent ambiguity regarding blogging in terms of its feminist potential has a striking affinity with previous debates regarding the late modern phenomenon of “postfeminism.” Postfeminism is an ambiguous term that has come to accommodate a wide range of meanings, describing everything from a feminist backlash to so-called contemporary “third-wave feminism.” The cultural theorist Angela McRobbie (2009) has extended and reformulated the notion of postfeminism, arguing that what the term captures is not so much a simple conservative backlash discourse as a way of affirming feminism on the one hand, while, on the other, “installing a whole new repertoire of meaning” that speaks more about how the goals of feminism have already been achieved, thus making feminism seem obsolete and old-fashioned (McRobbie, 2004, p. 259). It is McRobbie’s understanding of postfeminism that I shall employ in the argument being developed in this chapter.

Postfeminism, McRobbie argues, is an antifeminist cultural trend, where feminism has been “taken into account” but only for its obsolescence to be proven (2009, p. 130).² The postfeminist trend is, on this reading at least, inextricably linked to larger neoliberal political processes in which gender politics has been “disarticulated,”³ uncoupled from

previous political alliances made by the second wave of feminist struggle. Such disarticulation, McRobbie argues, explains how many feminist gains – achieved over the last three decades – are currently being eroded in the name of “modernization.” This “modernization” resembles a logic of “undoing,” undermining previous feminist alliances between both women and various political struggles (McRobbie, 2009, pp. 24–26). Gender issues become reformulated mainly in terms of simplistic notions of individual liberty, reducing freedom to professional and consumer choices (cf. Tasker & Negra, 2007, p. 2). It is worth pondering the specific relation between postfeminism as a way of describing the present situation and the recent explosion of girls and women engaged in blogging – not least considering the popularity of vastly consumer-oriented fashion, makeup, and dieting blogs (including so-called pro-anorexia, or “pro-Ana,” blogs). We need to interrogate whether the term postfeminism is an apposite way to designate the present horizon within which feminism is operating.

Already in the aforementioned *Guardian* article from 2006, the total number of feminist blogs was estimated at 240,000 (Cochrane, 2006; see also Beetham & Valenti, 2007). In contemporary Sweden, where the vast majority of the population has Internet access and the “digital divide” between men and women is now statistically insignificant, recent published data show that the majority of Swedish bloggers are young women; in fact, while only 8% of Swedish Internet users (and 6% of the general population) over the age of 12 are active as bloggers, blogging is rapidly increasing amongst girls and young women. As of 2010, the majority of females between 12 and 25 (and two-thirds of women between 16 and 25) either are active as bloggers or have previous experience of blogging themselves – and as many as 93% of girls between the age of 12 and 15, and 78% of women between the age of 16 and 25, are reading other people’s blogs (Findahl, 2010, p. 47). In the face of such empirical evidence, a number of critical questions ought to be raised. Is this rapid increase of girls’ and women’s blogging merely an extension of such general post-feminist developments? Can blogging at all serve as a feminist tool? More specifically, is feminist blogging contributing only to individualized forms of expression, based on the empowerment of single individuals, or does the weblog have a role in both the construction and endurance of collectivist forms of feminist politics?

It is hoped that this chapter will go some way toward responding to these questions by approaching the phenomenon of feminist blogging as a form of practicing citizenship. I shall do so first by situating feminist blogging within a larger historical context of media production in the feminist movement. This will be achieved by thinking of the particular forms by which feminist media have been produced within each of the “three waves of feminism.”⁴ From here I wish to argue that feminist media production can be thought of as a form of *citizens’ media*. Thereafter, I shall present three different feminist blog projects, investigating the various ways in which these blogs practice what in recent literature is discussed in terms of “intimate citizenship” (cf. Plummer, 2003) – a conceptualization of citizenship that I take to embody the multifarious meanings of “intimate,” including not only connotations of the body and of sexuality, but also in terms of “private,” “personal,” and “close.”

From Suffrage to Blogging: Generations of Feminist Media

While presently feminist blogging can be understood as a very “timely” and novel phenomenon, feminists using and making their own media have been a constituent part of the history of the women’s movement (cf. Steiner, 1992).⁵ First, I shall begin by establishing that feminist media have historically been a crucial means for feminist struggle to achieving citizenship.⁶ It should be quite easy to see that for the first-wave feminists, media such as newsletters, pamphlets, and posters served unequivocally as an important means by which to argue for formal citizenship rights. Consider, for example, the ways in which both the suffragist and antislavery activist Sojourner Truth (born Isabella Baumfree) sold photographs – so-called *cartes de visite* – of herself as a means to both disseminate her politics and to support herself financially (Irvin Painter, 1994), or how her fellow suffragists in the United States, as well as many other countries, devotedly produced not only their own press, but also other forms of media such as cartoons, postcards, and posters as a crucial way to argue for equal rights and to facilitate political mobilization (cf. Di Cenzo, 2003; Di Cenzo & Ryan, 2007; Perry, 1994).

Equally, media production played a significant role during the second wave of feminism, which in the spirit of 1968 published titles such as the US news journal *Off Our Backs* (since 1970), UK magazine *Spare Rib* (1972–1993), and the later UK internationalist feminist newspaper *Outwrite* (1982–1988). The Norwegian radio station *RadiOrakel* (ongoing since 1982), self-proclaimed as the world’s first ever feminist radio station, the German magazine *Emma* (since 1977), and numerous Swedish feminist bulletins (e.g., *Amazon*, *Lilith*) all began during the 1970s and 1980s.⁷ In the late 1980s and early 1990s, a new generation of feminists turned to self-publication, perhaps most notably as part of the rise of what in the Anglo-Saxon context is referred to as “the grrrl zine revolution” (Green & Taormino, 1997, p. xxi): a growing number of girls and women who began to produce their own do-it-yourself media in the form of “zines”⁸ – small, non-, or anticommercial DIY publications that are generally produced and distributed by a single individual or small editorial collective (cf. Duncombe, 1997).⁹ In Sweden, feminist zines started to circulate some years later than their English-language counterparts. While it should be noted that not all these zines explicitly expressed sympathies with the Anglo-Saxon zine network, they had in common with their “grrrl zine” peers a strong commitment to the characteristic DIY ethos of zine culture, as well as the tendency to speak with a personal voice about topics such as politics, popular culture, music, media, sexuality, and feminist issues.

Since the 1990s, technological developments have facilitated the distribution of paper zines – for example, by email communication, spreading information on listservs, and the occurrence of online “distros,” which make available a larger number of zines for sale. In addition, many zines have launched their own websites. For some of the feminist zines, new and accessible computer technologies have meant new opportunities to produce very professional-looking media products, while cheaper

digital (offset) printing methods have increased this development further by pushing down printing expenses. Alongside these developments, both in Sweden and internationally, a number of ezines were established with titles such as *Darling*, *Corky* (Sweden), *Geekgirl* (AUS), *gURL* (US), and *The F-Word* (UK), especially between the late 1990s and the early 2000s (Armstrong, 2004; Ladendorf, 2004). Subsequently, as Web 2.0 technologies have developed, many ezines have been replaced by the more user-friendly and interactive blog, a so-called “push-button publishing tool” that has often taken the form of a frequently updated online diary (Schilt & Zobl, 2007).

This brief exposé of feminist media production during the three waves of feminism not only reflects changes in the women’s movement’s political priorities over three centuries but also draws attention to some central technological developments, each of which have had a significant influence on the material conditions under which feminists have produced their media. Feminist movement media have largely been framed by three major technological “revolutions”: the printing press, the copying machine, and the digital revolution (including the personal computer and the Internet). Though care should be taken to avoid the suggestion of any technological determinism, it is worth noting that each of the aforementioned technological developments has had a profound impact on the conditions of possibility for the production of feminist movement media in different historical contexts.

These technological developments have offered new possibilities for feminist self-publication. While feminists of the first wave were largely dependent on the printing press, the media strategies of second-wave feminists also included the cheaper and more accessible photocopier, which allowed quick and inexpensive reproduction and subsequently came to play such a crucial part in the circulation of zines in third-wave feminism. This technological shift vastly increased the possibilities for feminists to begin producing media at home, without having access either to substantial financial resources or to technological expertise. This development has prospered even further in the wake of new information and communication technologies (ICTs), which have facilitated self-publication for anyone with access to a home PC, basic computer skills, and an Internet connection. Hence, feminist media production of the third wave exists in a partially individualized and personalized mediascape that has made social media such as Facebook, Twitter, MySpace, YouTube, and blogs an integrated feature of many people’s everyday lives. With this in mind, we now turn to a discussion of what kind of politics is possible within the context of feminist blogging.

Feminist Media as Citizens’ Media

While it is obvious, as previously mentioned, to understand the first wave of feminism as being concerned with citizenship, I shall argue that it is fruitful to investigate contemporary feminist media production through the lens of citizenship too – even if the modes of feminist media discussed in this chapter have emerged at a time and in a place where women’s *formal* citizenship rights have long been established. In doing so,

I am positioning my research within a theoretical tendency that reflects a recent shift of emphasis within critical citizenship studies, where scholars have gone from regarding citizenship merely as a legal status to calling attention to practices (such as routines, customs, norms, and everyday habits) of *making* citizenship. In short, this shift entails an analytical distinction between *formal* citizenship (i.e., citizenship as status) and *substantive* citizenship (i.e., citizenship as practice), and where the latter is understood as constitutive of the former (Isin, 2008). For the feminist movement, this means that it has developed over an extensive period of time through a plethora of diverse “citizenship practices,” such as theater, music, arts, and crafts, festivals, manifestations, meetings, networks – and, of course, media production (cf. Isin, 2008, pp. 17–18).

In similar terms, Clemencia Rodriguez (2001) has formulated a notion of *citizens’ media* that builds on the political theories of Kirstie McClure and Chantal Mouffe, both of which provide a far-reaching understanding of “the political,” an understanding that includes not only “juridical demands upon the state” but also a “quotidian politics – a politics which extends the terrain of political contestation to the everyday enactment of social practices and the routine reiteration of cultural representations” (McClure, 1992, p. 123). Rodriguez convincingly argues that citizens’ media have the capacity to actively transform the hegemonic mediascape by challenging social codes, legitimized identities, and institutionalized social relations and to empower “the community involved” (2001, p. 20). With a frequent use of everyday narratives and personal voice, contemporary feminist media (such as zines and blogs) can be said to embrace precisely this “quotidian” dimension of politics – even though their “politicizing of the personal” has not always been recognized as political. As others have pointed out, however, both off- and online media function as a way of sharing information, of building and of politicizing a community or network of girls and women (Harris, 2007, p. 46). New information and communication technologies have resulted in new and previously unanticipated social change that has afforded a new generation of Internet-savvy feminists to integrate online activities into their activism as well as their everyday lives (Aragon, 2008, p. 73).

As this chapter hopes to go some way to demonstrate, feminist blogging can, and indeed does, function as a form of practicing “substantive” citizenship – or, in other terms, as a form of citizens’ media. In doing so, it not only helps to build feminist networks and collective identities, but also it contributes to a redescription of gendered identities, behaviors, and regimes in novel ways, thereby putting what are generally understood predominantly as private, individual, and intimate problems on the political agenda.

“Bear Breasts”: Blogging and Collective Action

In early November 2007, the online version of the magazine *Ottar* (published by the Swedish Association for Sexuality Education, RFSU) announced that there was a

“new feminist wave of bare-breast actions” in public swimming pools. The event that precipitated a swathe of political activity occurred just a month earlier, in the university town of Uppsala. Two students, Ragnhild and Kristin Karlsson, had been expelled from the Fyrishof public swimming pool for public indecency; both had refused to cover their breasts whilst swimming. After this initial event, the expelled women made an official complaint to the Equal Opportunity Ombudsman (JämO) and published an opinion piece in the leading newspaper *Dagens Nyheter* (September 18, 2007). The complaint was rejected on the basis of insurmountable norms surrounding male and female bodies in contemporary society, where the situation of swimming topless is not comparable between the sexes. This, then, would justify the different treatment of men and women in this instance. Contemporary regulations regarding the selling of services and goods are such that in some cases it is permissible for women and men to be treated differently. Matters of “decency” would constitute one such example.

Shortly after this public debate, similar events were organized in swimming pools across Sweden. Again, the result was often the same: the expulsion of women from the venue. Responsible for this chain of events was the network *Bara Bröst*, a movement initiated by a group of women in southern Sweden sympathetic to Ragnhild and Kristin Karlsson. This, in turn, led to significant media attention in local and national Swedish media – but also in international papers such as the *Brisbane Times* and the *Washington Post*. That these events garnered much attention might not be surprising, given their typically “media-friendly” topic and provocative direct actions – but why, one may ask, did this issue so swiftly translate into a national feminist campaign? The following explanation is given on the *Bara Bröst* blog:

At first sight many think that this is a small issue that does not matter very much. But we ask you to think twice: Which structures does today’s law support? By using vague ideas such as “decency” and “current norms,” one makes it possible to cement destructive norms and modes of thoughts. [...] It takes courage by those girls who want to be part of breaking these attitudes, and to us this is an important issue about whose side the law is on. (February 14, 2007)

Importantly, the goal of the network ought not to be understood in terms of an issue of sexual liberalism, at least not in the first instance. Rather, the very purpose was to “provoke debate about the unwritten social and cultural rules that sexualize and discriminate the female body.” *Bara Bröst* claims that female breasts are not part of female genitals and therefore ought not to be treated as such. The blog itself serves as a rather straightforward means of informing people about their activities and principles, mobilizing supporters and participants for their campaign – which is clearly aimed at the Swedish government.

This focus placed on the government as the main target of the campaign transpires not only through the articulation of a specific demand seeking to challenge a specific law, but also in the range of political strategies in which the network is engaged,

where politics is defined in terms of lobbying one's elected members of parliament. One such example is a blog entry that contains a prewritten letter that readers are encouraged to reuse and send to Swedish MPs and local municipalities responsible for public swimming pools. Another is the traditional use of petitions. As the quote from the blog reveals, the aim is to shed light on and to challenge the ways in which what we can call gender "regimes" are reproduced in part by the governing bodies of the nation-state. In this manner, this very specific one-issue campaign and related direct actions link the seemingly banal question of swimming topless with fundamental sociocultural norms. What this campaign was capable of showing was the contingent nature of what are otherwise regarded as sedimented everyday practices, and how such practices are upheld by both public policy in particular, and by the law in general. Whilst the direct actions themselves perform a break with naturalized conventions, the blog serves to inform both supporters and "the generally interested public" about latest developments and future actions, as well as seeking to gain new supporters for its campaign. In this regard, the blog functions as a space where the action can be explained and its case argued for.

However, in addition, *Bara Bröst* uses the blog's possibilities for reader's comments, available as part of the blog tool, so that supporters (as well as opponents) can have their say on the issue. A blog entry entitled "Why does Sweden need a stronger discrimination law?," for example, initiated a debate that included as many as 207 readers' comments, expressing everything from encouragement – general comments of support – to harsh criticisms, misunderstandings, and even sexist remarks and disturbing threats. Many of the discussions generated on the blog used argumentation based on personal preferences and feelings as well as logical reasoning for and against topless-friendly swimming pools. Others, however, resorted to aggressive antifeminist comments, to which supporters then responded. The following is an example posted by two opponents:

Posted by: Ronny

So why should you be allowed to walk around at swimming pools and show your breasts? It is sick! Think of the kids. Fucking feminism [...] Shame on you! (April 2, 2008)

Posted by: Feminist hater

I will [strong language] seek for all the names on the list and give you a fat slap with a base ball tree [sic!]. (April 2, 2008)

While this type of exchange might be described as far removed from what we normally would wish from a "democratic debate," the choice not to moderate even such comments reveals the conflicts surrounding this issue, and therefore extends the function of this space beyond traditional political campaigning. Hence, it is clear that *Bara Bröst* is not only "sparking debates" in the mainstream media, it is also creating

an unusually inclusive space for political discussion – and, as such, constitutes one of the few public forums in which antifeminist remarks such as the above can be directly responded to by the people who are themselves subjected to such comments.

The crucial question remains, however: can these strategies be said to entail more profound societal changes beyond a few provocative newspaper headlines, outside of the blogosphere? It should be noted that, despite activists initially being expelled, the campaign did have a few successes, which were reported on the blog, with public swimming pools allowing topless women to swim on their premises. Moreover, the movement spread across the sea to Denmark, where, after similar direct action, the swimming pool in Vesterbro announced that topless swimming would be allowed during specified hours.

Importantly, the case of the *Bara Bröst* blog shows that feminist blogging can do more than merely spread information and “spark debates.” The feminist blogosphere should not be regarded as a sphere divorced from real-life feminist activism. On the contrary, the weblog can serve an important function in providing a meeting space that facilitates collective political mobilization and the creation of activist networks. The *Bara Bröst* blog is an example of how, at first glance, what might be understood as a simple case of single-issue politics need not necessarily be a question of the kind of feminist disarticulation of which McRobbie speaks, but should, rather, be understood in terms of active construction, that is to say, a *rearticulation* of feminist politics. As is the case with much contemporary feminism (in Sweden and beyond), the *Bara Bröst* network offers such an example.

While the *Bara Bröst* blog constitutes an example of how the blog tool can indeed be used as an integral part of a feminist activism that is practicing citizenship in more “traditional” forms such as political debating, direct action, and petitions, we now turn to the politics of the feminist “life log.” As Findahl reports, in 2009, 64% of all Swedish blogs were such diary-like “life logs,” consisting of personal micro-stories of everyday life; 26% had a specialized content (such as a hobby or special interest), 6% focused on work life, and another 6% were political blogs (2009, p. 33). While it is difficult to categorize feminist blogs (where, as we know, “the personal is political”) into either of these subsets, my research shows that a *majority* of contemporary Swedish feminist blogs contain strong elements of diary writing. As we shall see, this more prototypical diary-like format would offer a space to practice intimate citizenship not only in the “sexual,” or “bodily,” sense of the term, but also in the sense of the “personal” and the “private.” In order to explore this further, let us turn to the blogs of *Hanna Fridén: Feminist, Aesthetic Style Fascist* and *Linna: Write – Exercise – Talkative – Private*. Judging by the fact that both of these blogs bear the names of their respective authors, the way in which the prototypical diary format is followed would suggest that here we are encountering precisely such individualized and person-oriented media. But does this initial impression hold on a closer reading? In order to deepen our understanding of the significance of feminist blogging as a form of citizens’ media, I shall place emphasis on its importance for practicing what in recent years has been termed “intimate citizenship.”

Consciousness-Raising 2.0? Blogging against Anorexia

Operating under the slogan “80s child with a superhero complex. Saving the world, one PMT at a time,” the blogging persona of Hanna Fridén is represented as an empowered and strong young woman, whose fashion interests and meticulous detailing of her daily activities have attracted a dedicated readership. Similar to many other contemporary blogs by young women, her blog takes the shape of a “life log,” an online diary, as well as containing elements of a fashion blog. “Outfit of the day,” consisting of photographs of the author and comments on her chosen style, is a recurring feature on Fridén’s blog; in this way, it functions as part of the wider phenomenon of the fashion blog – a phenomenon that recently has increased enormously amongst young girls in Sweden and has had a significant impact outside of the blogosphere in the mainstream media. The most prevalent feature, however, is Fridén’s diary remarks, which readers are able to follow and have the opportunity to comment on. The diary presents Fridén’s daily travails as a fairly well-known media personality (with a history as illustrator, professional blogger, journalist, and television show host for the youth television channel ZTV on her curriculum). Adventures range from her first experience of flying, to photographs of social events she has taken part in, to intimate matters such as her previous struggles with an eating disorder and toilet problems. When granted little more than the briefest of looks, this highly personal “life log” appears to match the description of a feminist individualization, not least because of its representations of Fridén as a young, “twenty-something,” successful, and stylish media personality. Does Fridén, therefore, offer an example of a post-emancipated woman – someone who, while overtly embracing feminism and its goals, no longer needs it? Is it true that there is no explicit political agenda that Fridén follows?

Although the entries on the theme of party politics increased somewhat from the time of the Swedish general election in 2010, this is by no means a clear-cut political blog in the traditional sense of the word. Only reluctantly does Fridén admit that if she has to choose, “it has to be the Social Democrats” – and when politics is mentioned, it is often invoked by way of precisely the kind of “single-issue politics” that could easily be interpreted as a disarticulation of feminism from other political movements.

For all of the above reasons, the blog could be understood as part of the larger postfeminist trend of women’s issues and inequalities being “disarticulated” from the very political movements (such as the socialist movement) to which they have previously been linked. In one of the blog entries entitled “I detest party politics,” an explanation for its absence is offered. However, the reader discovers that such a “disarticulation” between women’s issues and politics is not something that is valid for her “offline life”:

I do not like discussing party politics here on the blog. As you have noticed, I do for the most part speak of single issues and specific societal problems. I am not uninterested in party politics, I discuss it on a daily basis in real life, mainly with regards to jobs and Swedish welfare, but on the Internet I only ever get frustrated when I write about it. Now, I have to blame myself a little bit, because I only do it when I am pissed off and perhaps it is not properly expressed. But still. (April 15, 2010)

So what happens if one takes a closer look at Fridén's writings? I think it soon becomes clear that her rather low profile on the particular issue of party politics does not mean that her blog is devoid of political engagement. Alongside the personal remarks and outfits of the day, a strong engagement in the issues of current beauty ideals and their connection to eating disorders amongst women is articulated.

Having recovered from anorexia herself, Fridén has devoted much effort to informing others about the current situation of systematic undereating amongst young girls, not least through her appearances in the mainstream media such as on Swedish state television (SVT) and in the tabloid newspaper *Aftonbladet*. In *Aftonbladet*, where she is invited to discuss the contemporary blog debates, she expresses disappointment with developments not only in society at large, but also in the blogosphere (Swedenmark, 2009). She explains how she previously had great hopes that the blogging of "ordinary" girls would counteract the unhealthy beauty ideals represented in the mainstream media, and adds that she thinks the effect has been quite the opposite: "When blogs began to gain attention I was hoping for a change, as the girls who were blogging were normal, not just skinny. But instead [of the beauty ideal changing] they [the blogging girls] lost weight" (Swedenmark, 2009). Further, she criticizes other famous bloggers for discussing weight and diets and claims that such online behavior seriously undermines information work on eating disorders. This emphasis on Fridén's personhood should not, however, be understood as the final destination for her media practice. Rather, it serves as a stepping stone toward more collective processes, similar to the consciousness-raising activities of previous ways of doing feminism. It is a virtual collectivity, however, that occurs in the comments field of her many blog entries on the theme of eating disorders.

In one of her many blog entries on this theme – for example, "Wake up, State, a whole generation of girls are starving to death!!" – Fridén raises strong criticisms against the Swedish state for ignoring the problem of a growing number of self-starving young girls:

I cannot understand why the state does not regard this more seriously than they do. I cannot understand why they do not give more money to [support the care of people with eating disorders] and to the education of people within schools [and similar sectors] so that they can learn to recognize the signals [i.e., symptoms]. The Swedish National Institute of Public Health has publicized figures that prove that underweight amongst girls aged 15–24 is a serious problem – and continuously increasing. But absolutely nothing is happening. (September 22, 2009)

She continues by criticizing the state for supporting the national fashion industry financially, despite the industry's maintaining the same unhealthy skinny ideals as the international fashion scene, and for its decision to make the diet pill Allí freely available over the counter. Fridén announces: "The party who will take these issues seriously, I will vote for in the next election. [...] This is not a marginal issue or any such shit, it's one of the absolutely most important issues of today." Although some comments remind the author and readers that a *svelte* figure is not necessarily a sign of anorexia, the vast majority of comments are supportive, either simply thanking her, or sharing personal experience of their own, a friend's or a relative's eating disorder, or contributing information such as links to organizations and support centers where those suffering from eating disorders can turn. One comment informs readers that the aforementioned dieting pill has an 18-year age limit, though it is countered by Fridén's claim that the rule is not followed in practice. Another comment simply states that: "You are so bloody right! I am with you! All the way!" Many others show their support by hyperlinking from their own blogs, encouraging others to do the same.

As others have argued before me, virtual spaces like this can, and indeed do, function as a form of consciousness-raising activity, not unlike feminist consciousness-raising groups of the 1960s and 1970s (Kennedy, 2007; Wood, 2008). Tracy L.M. Kennedy argues, for example, that "As early feminists recognized, telling stories is often only the beginning of a larger feminist process of engaging collectively to pursue social reform" (2007, n.p.), and she continues to argue that blogging offers precisely such opportunities today (Kennedy, 2007). Although there are some similarities between consciousness-raising practices, the crucial differences from the consciousness-raising of the second wave ought not to be ignored, since they carry particular significance for the ways in which we can understand contemporary feminist practices on their own terms. For what differentiates much consciousness-raising activities of second-wave feminism is that while personal storytelling was used, a shared female experience was generally presupposed, constituting something of a master-narrative, that is to say, a unitary understanding of a universal experience of living as a woman in a patriarchal society.

Third-wave feminism is generally understood to pursue a more "anti-essentialist" political agenda, placing a stronger emphasis on diversity. On this basis, third-wave feminism has signified a feminist generation that has been accused of being overtly individualist and lifestyle-oriented, and of lacking any significant political agenda (Pilcher & Whelehan, 2004; Siegel, 1997). It has, in other words, often been understood as "postfeminist," in the above meaning of the term. But while many available blogs (such as the vast number of contemporary fashion blogs) could indeed be labeled as postfeminist, this is no grounds for judging blogging as a feminist tool *per se*. While the rise of "the feminist blogger" may seem like an explosion of individual narratives without any unified political program, this tendency should be placed within the more general late modern *Zeitgeist* in which precisely such practices of "storytelling" operate as a central tactic to enact what sociologist Ken Plummer

(2003) has baptized “intimate citizenship.” In late modernity, Plummer argues, there is an absence of metanarratives. Late modern society is characterized by rapid changes in our personal lives across the globe (most notably in the Western industrialized world). Concomitantly, this has led to an increasing number of activities demanding existential decisions at the most intimate level: “from test tube babies and cybersex to lesbian and gay marriages and families and single parenting” (Plummer, 2003, p. x). This has opened up a new space for an increased production of “micro-narratives” of everyday experiences. Precisely such intimate stories constitute a main feature of feminist blogs. An interesting case, worthy of further exploration in relation to the connection between online activity and feminist politics, is the weblog of Linna Johansson, who has, amongst other things, written about the vicissitudes of childrearing and familial experience.

Micro-Narratives of Motherhood: Politicizing Childbirth and Breastfeeding

It never became that second, easier birth. It was approximately like the last one: weepy, laborious, bloody awful, and, I guess, quite ordinary. [...] I find labor completely superfluous. Not cool, not fantastic, just painful, so painful that I first have to digest the fact that I have actually survived before I want to hold my child in my arms. I was sitting on the bunk for nearly an hour. Crying quietly. My hair was unbelievably tangled, divided into thick, wet sausages, like dreadlocks. Despite the double layer of blankets I was freezing so that I was shivering. The cold and the pungent blankets threw me back to an interrail trip and the border control somewhere between two Eastern countries – Slovenia, Slovakia, Hungary maybe? – darkness, dogs on tight leashes, foreign language. (July 7, 2009)

The birth story told by Linna Johansson is “only” a single individual’s experience of labor; it does not make any claims on the “truth” about childbirth. Yet I would argue that it constitutes a powerful counternarrative that “talks back” to popular stereotypes of the process of labor as “natural,” “beautiful,” and “miraculous.” In Johansson’s story, childbirth is, instead, described as a painful, ugly, and fully expendable experience. She writes about the aftermath of childbirth in terms of what can perhaps best be described as austerity and alienation, a feeling of non-belonging; the narrative certainly does not describe the well-rehearsed cultural image of the new mother who in an instant forgets the pain of labor as she holds her newborn baby in her arms for the very first time.

Johansson’s story does not end here. It develops into a longer counternarrative about life with a young baby. Here another cultural stereotype of motherhood is contradicted, as the story from the maternity ward continues:

Just as I was about to gather myself together another midwife entered to tidy up. Shoulders pulled up, stiff upper lip – I guessed the indignant question several minutes before she finally got it out: “Now I have to ask . . . – *why do you not want to breastfeed . . . !*” I took a deep breath, and I was crying inside over the fact that I, in this broken state, would have to *debate*. Then I hear [the father] from his corner – I had forgotten about him, the baby – tell her to leave us alone. Something in this scene, how she limps out, [the father] with the bundle in his arm and a glance – mild, fragile and very grown up at the same time – makes me realize that it is over, now it is actually over. (July 7, 2009)

Despite not adding any of her own meta-analysis to this particular story, this micro-narrative has to be understood in its wider context as part of an ongoing struggle for intimate citizenship, in terms of both a longer struggle Johansson has undertaken in the public domain since the birth of her first child and a larger cultural struggle over the issue of breastfeeding. Johansson’s position is that it is a woman’s inalienable right to choose whether or not she wants to breastfeed her children. This is presented by way of highly individualized stories.

In Sweden, where the practice of breastfeeding is comparatively high in international comparisons – 97% of newborns and 67% of 6-month-old children are fully or partially breastfed (Socialstyrelsen, 2010, p. 8) – opposing voices are barely audible. And even though there are occasional debates in the mainstream media about breastfeeding – whether, for example, it should take place in public or not – breastfeeding nonetheless constitutes a sedimented and unquestioned “good.” As such, Johansson’s repeated micro-stories have broken a taboo regarding breastfeeding, opening up a larger debate on the issue. In one of Johansson’s many blog entries, readers have made the following comments:

It is so nice to read what you write. Those thoughts were mine too, but I never went all the way, I am far too afraid of conflict. Haha, you should be blogging at Mama [a parenting magazine], something like this would be needed there, you can’t deviate too much from peer pressure there. (Comment posted June 15, 2009)

Each and everyone has to decide [for themselves] and your midwife is STUPID. I have encouraged several sad friends to stop breastfeeding when they haven’t wanted to or it hasn’t worked [...] Despite this, I have to be honest; I would rather have lost my left arm than miss out on breastfeeding. I have been a lazy mum; jiggle around with bottles when you are going out or at night – *never*. (Comment posted June 15, 2009)

Notably, neither of these comments advocates a single determined position on the issue. Both agree on a woman’s right to choose. Though the odd exception does exist, the opponent in the general discussion is not women who choose differently from the writer but, rather, the medical establishment – most often represented by midwives – which is said to steer the choices mothers make, either persuading parents to complement breastfeeding with formula against their will, or the opposite. Clearly, not all comments support Johansson and her choice. Some commentators try to

encourage her to “at least try,” while others accuse her of being selfish in her decision not to breastfeed. Nevertheless, it is striking how much emphasis is made in the comments on a felt normativity in meetings with medical establishment representatives (most notably midwives). As one commentator explains:

I have never been able to put my finger on it before, but the meeting with [the maternity and the infant clinics] is like reliving [my] relationships with adults during my school days. One was completely omitted from these authorities. (Comment posted June 15, 2009)

As this example goes some way to demonstrate, the emphasis on the “everyday” makes the weblog both a production and a reproduction of contemporary rearticulations of some of our most intimate experiences – here exemplified by individual experiences of childbirth and breastfeeding – but it also showcases how the blog in this case becomes a privileged site for practicing intimate citizenship. In keeping with Elzbieta Oleksy’s conceptualization of intimate citizenship, Linna Johansson’s micro-narrative exemplifies not only how our private decisions and practices in late modern society have become “intertwined with public institutions and state policies such as public discourse on sexuality, legal codes, medical system, family policy and the media” (Oleksy, 2009, p. 4), but also how the blog offers a platform from which, through the practice of everyday storytelling, citizens can challenge dominant regimes, policies, and practices concerning their intimate and quotidian experiences, helping to construct thereby virtual networks of solidarity.

Blogging Citizenship – Doing Feminism: Concluding Remarks

As this chapter has demonstrated, feminist media production has continued to thrive throughout what has commonly been referred to as the third wave of feminism. Although there is no general consensus about what exactly characterizes this third wave, it is usually defined on the grounds of generation, ideology, and/or historical context (Henry, 2004). As political theorist Jonathan Dean writes, “there is a perception that [the third wave] share(d) a certain commitment to openness, diversity and plurality that was perceived to be lacking in many dominant strands of second-wave feminism” (2009, p. 336). The attempts to characterize this third wave on the basis of historical or generational perspectives have often emphasized how this age cohort of younger feminists (born during the 1970s or after) has grown up in precisely the kind of postfeminist milieu that McRobbie describes as one in which feminism is simultaneously affirmed and denounced, that is, described as something that once was important but now has played out its role. As such, this “new” generation has

been said to “live feminism in constant tension with postfeminism, though such a tension often goes unnoticed as such” (Kinser, 2004, p. 133) – something that is telling in both the oft-repeated conflation between postfeminism and third-wave feminism and the skepticism shown toward the practice of blogging, a skepticism expressed in the question: “Just who *are* they representing?”

In order to provide an answer to that question, we need first to acknowledge that the recent and rapid expansion of the Internet and new ICTs have meant that one can no longer equate feminism on the Internet with a specific “cyberfeminism.” Rather, the Internet has become an important domain for political activity for all strands of feminism. Second, we need to consider the ways in which the Internet has expanded the possibilities for production of “late modern” feminist micro-narratives – as both a continuation of the feminist tradition of feminist consciousness-raising *and* as a way to challenge the very principles of a shared experience between women on which the practice of consciousness-raising has often relied. Instead of using personal narratives to find a “common truth,” feminist storytelling of the third wave is said to place a stronger emphasis on diversity and multiplicity in personal experiences of gendered relations and modes of identification. Third, it is important to note that, despite the current feminist emphasis on diversity, the micro-narrating that takes place through feminist blogging should be understood *neither* simply as an effect of individualist postfeminist commodification of “feminism via the figure of woman as empowered consumer” (Tasker & Negra, 2007, p. 2), *nor* as a number of disparate isolated individual “voices.” For unlike postfeminist appeals to consumerism as female empowerment, feminist bloggers are engaged not so much in a practice of *disarticulating* feminism as in a continuous process of *rearticulating* feminism and feminist issues. Instead of contributing to an *undoing* of feminism, feminist bloggers are involved in a continual process of *redoing*, both in the meaning of carrying on already established feminist struggles (such as a critique of beauty ideals, motherhood, and bodily autonomy), and in the sense of articulating new feminist issues (such as the right to swim topless in public swimming pools).

Although blogs to a much larger extent than most previous forms of feminist media (e.g., newsletters, bulletins, zines) are located within the vastly commercialized arena of the Internet – and hence at first glance might be more easily dismissed as part of a more general postfeminist trend – such a premature dismissal would risk blinding us to the ways in which blogs can function as citizens’ media by both collectively *and* individually contesting social codes, institutionalized gender relations, and legitimized gendered identities, as well as the potential for blogs to mobilize for offline political activism and formulate demands regarding their intimate lives against state regimes. Hence, while I would not go so far as to claim that blogging is an *inherently* feminist activity – and while its role for women’s organizations with regard to government representation might still, in many cases, be rather obscure – it can nonetheless be said that on the World Wide Web there exists a cohort of feminist bloggers representing a wide array of contemporary modes of being feminist – indeed, of doing feminism.

Acknowledgments

The work on this chapter was conducted mainly as part of my postdoctoral fellowship at the Department of Ethnology, Religion, and Gender Studies at Stockholm University (2009–2010), as well as during my previous time within the collaborative research project Feminist Media Production in Europe (funded by the Austrian Science Fund, project no. P21187-G20). In addition, I would particularly like to thank David Payne for his proofreading of my use of the English language, as well as his intellectual feedback on previous drafts of this chapter.

NOTES

- 1 All quotes from Swedish websites and blogs have been freely translated into English by the author.
- 2 Many thanks to Elke Zobl for recommending this text to me.
- 3 The process of disarticulation, in short, describes the counter-logic of political theorists Ernesto Laclau and Chantal Mouffe's concept of *articulation*, which is a primitive political operator, capturing the basic mechanism by which various political struggles (women's movements, workers' movements, environmental movements and so on) build cross-over alliances, expanding their political horizon with other collective identities and social movements (1985, p. 110).
- 4 It should be noted that while the metaphor of the "three feminist waves" constitutes a popular and widespread way of describing the history of the feminist movement, it has also been criticized for obscuring the diversity within various strands of feminism and age cohorts of feminists, as well as for its overemphasis on the Anglo-Saxon and Western European contexts (cf. Graff, 2007; Hemmings, 2005).
- 5 In the Swedish context, this is an empirical fact that has recently been the subject of celebration. In 2009, Swedish women's magazines and journals celebrated their 150-year jubilee. The Women's History Collections (*Kvinnsam*) in Gothenburg have been exhibiting (both on- and offline) a variety of women's journals to mark the occasion, from *Tidskrift för hemmet* ("Journal for the Home") from 1858 to more recent titles such as the feminist zines of the 1990s and 2000s (*Radarka*, *Bleck*, *Tigerskott i brallan*) and the still extant magazines *Bang*, *Femkul* (currently entitled *FUL_*), and *Kvinnotryck* – as well as online variants such as queer ezine *Trikster*.
- 6 Bearing in mind its central role for the feminist movement already in the nineteenth century, when the so-called first-wave feminists began their struggle for citizenship rights, it is surprising how little has been written about both the history and the theory of feminist media production. The few exceptions to this general deficit have often focused predominantly on the very specific genres of feminist zines (also referred to as "grrrl zines," femzines, or feminist fanzines) (Zobl, 2004a, 2004b) and cyberfeminist practices (e.g., Kearney, 2006), and most often on the Anglo-Saxon context. Feminist scholars such as Jayne Armstrong, Red Chidgey, Mary-Celeste Kearney, Marion Leonard, and Elke Zobl have carried out important investigations into the international zine networks. These

- pioneering studies are now being complemented with examinations of zines from other parts of the world (e.g., Chidgey, 2009; Zobl, 2009).
- 7 More recent examples of feminist media production globally are the Nicaraguan feminist quarterly *La Boletina* (since 1991, also available online since 2005); the Iranian independent feminist journal *Zanan* (founded in 1991, banned in 2008); and the Croatian magazine *Kruh & Ruze* ("Bread and Roses," since 1993/1994).
 - 8 Although there is no set standard for what a feminist zine can look like, many are produced by simple techniques (handwritten or typed, cut-and-pasted collages, drawings, photocopies stapled by hand), while others have developed into more "glossy" magazine-like products (cf. Harris, 2007, p. 46).
 - 9 For more examples of feminist media, especially in the European context, see the online archive <http://www.grassrootsfeminism.net/>.

From Second-Wave to Poststructuralist Feminism

Evolving Frameworks for Viewing Representations of Women's Sports

Marie Hardin and Erin Whiteside

ABSTRACT

In this essay, we trace the evolution of scholarship on media representations of women's sports. Introspection about our own work in this area has brought us to consider the potential of *third-wave/poststructuralist* feminism as a theoretical lens for our own critical inquiry into depictions of women's sports. We trace the trajectory of our work by first reviewing second-wave feminist critiques of representations of women in sport and the solutions stemming from those critiques. We then consider the development of our own research and the possibilities of a poststructuralist lens in that work, assessing how such a perspective might offer useful alternatives to standard, Gramscian-oriented critiques of the coverage of women's sports.

When *Sports Illustrated* presented skier Lindsey Vonn on the cover of its 2010 Olympics preview issue, some feminists roundly critiqued the picture. The photo, which depicted Vonn dressed in ski apparel but sans helmet, hair cascading down around her smiling face as she mimicked a ski crouch, was judged as the latest example of a problematic and ongoing trend of media outlets sexualizing and hyperfeminizing female athletes. Judging Vonn's image as a step backward for women's sports reflected the position of many influential sports feminists, most of whom work from a radical feminist standpoint. Radical sports feminists argue that the projection of femininity,

including emphasis on a “hetero-sexy” image (Griffin, 1998, p. 75), in depictions of female athletes reinforces traditional gender roles. In doing so, it delegitimizes women’s sports and preserves sporting spaces as *male* spaces.

At the same time, however, others suggested that the cover represented a step forward for women’s sports, and, therefore, something that should be celebrated. *Sports Illustrated* almost exclusively puts men on its covers (Bishop, 2003), and by featuring Vonn, the magazine framed women’s skiing – and to a degree, women’s sports in general – as the focus of one of the biggest sporting showcases in existence. Vonn appeared in the magazine’s famous annual “swimsuit edition” a week later, which was also touted as positive for her, for the sport, for her Olympic team, and even for girls who aspired to follow Vonn (Russo, 2010). Vonn’s teammate, Kaylin Richardson, told a reporter, “‘For little girls, there’s something to see – a beautiful, athletic, strong, powerful, female body among all these real thin models in the magazine’” (Russo, 2010, para. 2).

The debate over the photos of Vonn is indicative of the quandary in which women’s sports advocates find themselves when considering depictions of female athletes in the sports/media complex.¹ Radical feminists, who are firmly entrenched in the movement’s “second wave,” read Vonn’s representation as oppressive – reinforcing traditional gender ideology that preserves a stifling status quo and reflects a dangerous practice in postfeminist discourse (Carty, 2005; Duncan, 1990). Ultimately, the disconnect between radical/second-wave feminists who work on behalf of women’s sports and the high-profile female athletes who insist that feminized/sexualized images are empowering has been a vexing issue for women’s sports advocates.

We suggest that an alternative lens for considering depictions of female athletes in the sports/media complex, however, lies in *third-wave/poststructuralist*² feminism. At the heart of the difference between traditional second-wave feminism and third-wave feminism, in short, is the way each approach conceptualizes *power* – its definition, its use, and its effect. Second-wave feminism, especially radical critiques (including our own), rely on a Gramscian lens, which explains the communication of ideology as purposive in that it naturalizes a power structure that is beneficial to certain groups and destructive to others (Altheide, 1984). Those in power often have unequal access to resources that facilitate the communication of dominant ideology. In sports media, that group is considered media companies, sports journalists, and editors, who serve as gatekeepers and thus play a critical role in deciding not only how much coverage to dedicate to women, but also how to present that coverage to the sports audience. Such a perspective on power has been both useful and limiting in explaining why women are so often marginalized from sports media and depicted in problematic ways. Those limitations have invited self-reflection on our part, as we have considered the prescriptions for change offered in our own work.³ That introspection has brought us to consider the potential of *third-wave/poststructuralist* feminism as a theoretical lens for our own critical inquiry into depictions of women’s sports. We trace the trajectory of our work by first reviewing second-wave feminist critiques of representations of women in sport and the solutions stemming from

those critiques. We then consider the development of our own research and the possibilities of a poststructuralist lens in that work, assessing how such a perspective might offer useful alternatives to standard, Gramscian-oriented critiques of the coverage of women's sports.

Hegemonic Masculinity and the Sports/Media Complex

In 1972, the US government passed Title IX of the Education Amendments, which afforded women equal opportunity and funding in sports at institutions receiving federal money. The law has been credited as the impetus behind an astounding growth in sports participation among women (Suggs, 2005). In 1968, for instance, roughly 16,000 women competed in varsity sports at the collegiate level. By 2010 that number had exploded to more than 180,000 (Carpenter & Acosta, 2010).

Given the huge participation numbers, second-wave feminists have critiqued the relative paucity of coverage in mainstream sports media and have also urged gatekeepers to make choices in media coverage that reflect an undeniable interest in women's sports. Yet, as the Vonn picture illustrates, advocating only for women's inclusion in sports media texts has its limits, and radical feminist scholars have advocated giving renewed attention not only to the *amount* of coverage female athletes receive, but also to the *type*; many images appeal to the sexual desires of men and, in doing so, trivialize the accomplishments of female athletes and stunt the growth of women's sports (Bernstein, 2002).

Hegemonic Masculinity

Implicit in these second-wave critiques is a conceptualization of power that is locatable in the hands of men and the institutions they control and expressed through the structures and practices of sports. Scholars have widely drawn from Gramsci's theory of hegemony to explain the ways male power functions in sports. Simply, hegemony is a process that reinforces certain norms and ideas to the benefit of society's most powerful groups. These "commonsense" assumptions thus normalize certain behavior or groups while making others seem unnatural or wrong (Altheide, 1984; Condit, 1994). Ultimately, hegemonic institutions such as education, government, religion, and media build a stratified society that most benefits the dominant group. Power, then, is held in the hands of a relative few and used to coerce the wider populace, including disenfranchised groups such as racial minorities, individuals with disabilities, and women, into compliance (Artz & Murphy, 2000).

As radical feminists have long argued, sport is one of many cultural institutions structured and maintained to benefit a powerful group – men. Thus, even seemingly

innocent displays should be interrogated as ideological practices with political and social implications. Creedon (1994, p. 5) offers an apt example:

At minimum, because professional football remains a male-only preserve, we learn that being male in our culture confers a degree of privilege. By denying women access to the game as players, we are taught that women are less qualified, powerful or physical than men.

Ultimately, prevailing value systems in sports privilege behavior and traits associated with mainstream notions of masculinity such as physicality and unrestrained competition, thus making women's participation appear unnatural (Duncan, 2006; Hargreaves, 1994). The consistent message reflects an ideology, or set of beliefs, that sports belong to men and should be protected as a space for celebrating masculinity.

Because sports traditionally have symbolized hegemonic masculinity, they have been positioned as incompatible with hegemonic femininity. Competitive sports are the purview of men; women who seek to participate in sports, then, are suspect (Griffin, 1998). Women's inclusion challenges the link between sports and masculinity, and when women do tread on so-called "male terrain," they face cultural penalties in the form of stigmatization for failing to conform to traditional gender roles (Kane & Parks, 1992).

The sports/media complex is a key site for reinforcing masculine hegemony in a highly visible, culturally powerful way. Mediated depictions of sport have been indicted as "bearers of masculine hegemony, an ideology or set of beliefs about the world that privileges men and disadvantages women" (Duncan, 2006, p. 231). For example, in sports talk radio, sexist discourse is used as a mechanism for male bonding and status building (Nylund, 2007). Positive and desired cultural values, such as hard work, persistence, leadership, and even heroism, are expressed as representations of masculinity in descriptions of male athletes (Denham & Duke, 2010). Other research has showed the ways mediated discourse trivializes women's sporting accomplishments, from overt sexual references to subtle comments that infantilize women and, by extension, their achievements (Duncan, 2006).

Sports Feminism

Hargreaves (1994) calls the collective effort to eradicate gender discrimination in sports "sports feminism," a movement that has gained momentum alongside the growth of second-wave feminism. Despite the growing number of women's sports advocates, "sports feminism" is not a unified theoretical perspective. Rather, Hargreaves (1994) characterizes it as loosely organized around the belief that women are subordinated through sporting practices and that male power must be contested in order to change these oppressive practices.

In assessing media practices, scholars have largely justified their critiques using liberal and/or radical feminist arguments. These feminist critiques are all part of what has been called feminism's "second wave," which can be understood in chronological terms as the women's rights movement that emerged after World War II and recognized women connected through oppression grounded in a common material reality (Lotz, 2003). Liberal and radical feminists differ in their prescriptions for change, but both, however, conceptualize power as held in the hands of men, exerted from the top down, and thus something that must be challenged (Hargreaves, 1994). According to second-wave feminists, that power has resulted in two persistent problems in sports media: (1) a general *lack* of women's sports coverage; and (2) a general *lack of quality* women's sports coverage.

Sports feminists have prioritized these issues differently. Feminists with a more liberal orientation, which advocates "equality" as an unproblematic concept, generally advocate for increased coverage of female athletes and use coverage of male athletes as the benchmark. On the other hand, radical feminists, who are concerned with how dominant ideology in sports marginalizes women, suggest that calling solely for increased coverage is inadequate. Instead, radical feminists advocate for challenging structural systems that invite problematic representations, such as presenting female athletes as sexualized objects for male consumption.

Liberal Feminism

Liberal feminist ideology characterizes the justification for Title IX (Hargreaves, 1994). The law, which mandates equal opportunity and funding for women, represents fundamental US values of equality and social justice, the cornerstones of liberalism. In advocating for fairness in access, the liberal feminist movement leaves the ideological terrain of sports untouched. Instead, liberal feminists take the value systems of sports as a given and advocate for women's inclusion within them.

In a similar way, women's sports advocates have called for fairness in sports representations (Messner, Duncan, & Cooky, 2003). The Women's Sports Foundation (WSF) has been a leader in the liberal feminist movement, pointing out oftentimes gross inadequacies in coverage and pressuring sports media producers to include women's sports in their coverage. The WSF's efforts are a response to consistent trends in academic research that show women's low status in sports pages and broadcasts.

In general, although women's sports participation has exploded since the passage of Title IX, women are often marginalized or excluded from coverage. As gatekeepers, media producers have "continued to allot a disproportionately high amount of coverage to men's sports," a trend that research has shown to be consistent over time and medium (Messner et al., 2003, p. 48). Countless studies examining women's sports coverage have confirmed what is obvious from a casual glance through the sports pages: female athletes are routinely marginalized from coverage. The

marginalization spans the spectrum of media outlets from children's magazines (Cuneen & Sidwell, 1998; Duncan & Sayaovong, 1990; Lynn, Walsdorf, Hardin, & Hardin, 2002), daily newspapers (Eastman & Billings, 2000; George, Hartley, & Paris, 2001; Pedersen, 2003), sports magazines (Bishop, 2003; Lumpkin & Williams, 1991), and programming on ESPN and CNN (Eastman & Billings, 2000; Messner et al., 2003).

The late 2000s success of several female athletes and teams, including the University of Connecticut women's basketball program, has spurred a renewed debate about the lack of coverage given to female athletes. After the Huskies' first undefeated national championship season in 2009 – in which they won every game by at least 10 points but received little attention beyond the immediate Connecticut media market – one writer suggested that “one can only imagine the press coverage a men's player or team would receive in similar circumstances” (Trinkle, 2009). This comparison to men exemplifies the liberal feminist approach to equality and fairness.

Symbolic Marginalization

Scholars have historically used the term “symbolic annihilation” to describe women's lack of representation in media, a term first coined by Tuchman (1978). The concept has been applied to the similar observation in sports media; as a recent content analysis showed, women's sports receive just 1.6% of the overall airtime on local and national sports television programming, down from 6.3% in 2004 (Messner & Cooky, 2010). Scholars argue that the exclusion of women represents a failure to acknowledge their accomplishments and denies women's sports and female athletes full legitimacy in the sporting landscape (Adams & Tuggle, 2004; Duncan, 2006; Eastman & Billings, 2000; George et al., 2001; Pedersen, 2003). This denial of coverage can be seen in Gramscian terms as a denial of power for female athletes; they are constructed as generally insignificant by their failure to secure visibility (Wright & Clarke, 1999).

From a liberal feminist perspective, various examples suggest fissures in the power structure. Since 2003, ESPN has aired all 63 games of the NCAA women's basketball tournament; in addition, the 2004 championship game was the second most-viewed basketball game – men or women, college or professional – in the network's history until that point (Rodgers, 2004). Various companies regularly use female athletes for advertising campaigns, and in 2003 Serena Williams signed a \$60 million contract with Nike (Carty, 2005). Regional sports networks such as the Big Ten Network (BTN) provide live coverage of a variety of women's sports. In the spring of 2010, BTN aired 22 live softball games, streamed another 29 online, and also broadcast the women's golf, rowing, tennis, and outdoor track conference championships (“Big Ten Network boosts,” 2010; “Big Ten Network to televise,” 2010).

These gains represent a move toward equity advocated by liberal feminists and reflect an advancement of women's sports from the complete “annihilation” in sports media described by scholars little more than 10 years ago (see, e.g., Duncan & Messner, 1998; Fink & Kensicki, 2002). Thus, it may be more useful to refer to

women's representation in sports media as "symbolic marginalization." The term accounts for the very real gains made by women's sports in securing (albeit limited) space in sports media discourse while also describing the cultural effect of the still low amount of coverage received by female athletes and teams.

Radical Feminism

The work of radical feminists has illustrated the limitations of advocating only for quantity in terms of women's sports coverage. When female athletes receive mediated attention, they are often depicted in ways that de-emphasize and trivialize their athletic accomplishments. For instance, scholars have described how in analyzing the exploits of female athletes, TV commentators compare them to male athletes; failure to make analogous assessments in reverse implies a male-as-universal-standard (Eastman & Billings, 2000; Kian, Vincent, & Mondello, 2008). Messner and colleagues (2003) found that televised in-depth features on women often include subtle sexual jokes and humorous commentary that invite viewers "to engage in sexual voyeurism" (p. 42). Other research has noted the ways women are infantilized in commentary and texts, such as through references to them as girls, by their first names, or monikers like "America's Sweetheart" (Duncan, 2006).

Women featured in sporting images often represent individual sports such as tennis or skiing rather than team sports such as basketball or softball. As Hardin, Lynn, and Walsdorf's (2005) analysis of women's sports and fitness magazines showed, the most popular titles showcased women running or cycling. Further, they found that women were rarely featured in strength sports such as basketball or football. De-emphasizing team competition where physical contact is usually a defining element suggests women are weak, inferior, or incapable of playing such sports (Duncan & Hasbrook, 2002). Scholars have also pointed to the consistent practice by journalists of presenting female athletes in passive poses, away from their sport and adorned with feminine markers. This practice was documented by Fink and Kensicki (2002), who found that 56% of the photographs featuring female athletes in *Sports Illustrated* depicted them in passive poses. The Vonn case, presented in the introduction to this chapter, is illustrative. Although featured on the magazine's cover (a rarity, as only 4% of *SI* covers feature women), Vonn's representation was indicative of *Sports Illustrated's* consistent type of feminized and sexualized coverage of female athletes (Bishop, 2003; Fink & Kensicki, 2002).

Sexualized and Disempowered

Critics have compared these "hetero-sexy" images of female athletes to soft-core pornography, characterizing the depictions as disempowering for the individual women who replicate women's subordinate role in society through images in which they offer their bodies to men. Indeed, the popular *Sports Illustrated* swimsuit issue features female athletes alongside traditional models; Vonn's appearance in the

magazine includes a picture of her looking directly at the camera while hooking her thumb under her bikini bottom – as if to suggest she is ready to remove it. Teammate Hannah Teeter appears topless with a ski hat and boots. Other pictures of the skiers reflect similar themes. Tennis stars Serena Williams and Anna Kournikova, softball standout Jennie Finch, former WNBA Most Valuable Player Lauren Jackson, and Olympic gold medal swimmer Amanda Beard have all appeared in the magazine. Further, prior to the 2000 Olympics, *Sports Illustrated* printed a story on five-time gold medal-winning swimmer Jenny Thompson. Although the story focused on her ability in the pool, the opening full-page photograph featured Thompson topless, wearing clingy shorts and red boots while covering her breasts with her hands. Yet, it is problematic to call these women victims. *Sports Illustrated* later said it had no intention of asking her to pose topless when the photo shoot began, and that it was in fact the swimmer's own idea. Asked about the photograph, Thompson told a reporter, "I'm an athlete and athleticism is about physicality. I'm proud of my body and the work it's taken to get it where it is" (McCallum, 2000). Other sportswomen have willingly capitalized on their sexual attractiveness. Although Kournikova is far from the most successful athlete on the women's tennis tour, she received a glut of attention after posing in magazines and other media products aimed at men. "She clearly poses for many of the photographs and in general does not shy away from the 'tennis Madonna' label. As a result, she has made millions from endorsements" (Bernstein, 2002, p. 425).

Radical feminists have strongly critiqued these images and related commentary, arguing that such images do not attract fans to women's sports (Bernstein, 2002; Duncan, 1990; Kane & Maxwell, 2011; Krane, 2001; Messner et al., 2003). Further, they see images and representations that showcase women's passivity or sexual attractiveness as reifying women's "otherness" and "difference" in the context of sports and have characterized those kinds of images as nothing short of toxic for the future of women's sports. Duncan (1990, p. 40) writes, "Focusing on female difference is a political strategy that places women in a position of weakness. Sports photographs that emphasize the otherness of women enable patriarchal ends."

Radical feminists further note the way such images and discourse buttress compulsory heterosexuality. They see these media representations of female athletes as an "attempt to impose traditional images of femininity and sexuality on sportswomen" (Kane & Lenskyj, 1998, p. 188). Lesbian sportswomen, conversely, are erased from public view in favor of women that meet heteronormative standards.

Thus, as radical feminists have articulated, calling for *more* coverage does not necessarily mean that coverage will be liberating for women. In assessing the type of coverage female athletes receive, many scholars hedge at accepting it as a bona fide "step forward" because of the sexualized and trivialized nature of representations (Bernstein, 2002; Messner et al., 2003). As Bernstein (2002, p. 426) cautions: "[T]he appearance and attractiveness of female athletes – from a male perspective – are an important factor in explaining the *type* of media coverage they get. In this respect it is much too early for a victory lap."

In light of the exponential growth in women's sports participation, sports feminists have strongly critiqued media gatekeepers for making decisions that reinforce ideology that naturalizes sports as a male preserve, thus stunting the future growth of women's sports (Duncan, 2006; Eastman & Billings, 2000; Hardin & Shain, 2005; Kane & Lenskyj, 1998; Messner et al., 2003). As Messner and colleagues argue, how can audiences appreciate the talents of female athletes if the only stories viewers see are ones that poke fun at women, showcase their sexuality, and are "peppered with locker room humor" (2003, p. 49)?

Challenging Dominant Practices

Because hegemony considers power as centralized, and thus locatable, it is possible to prescribe ways for challenging dominant ideology with the goal of liberating marginalized groups (Lull, 1995). From a Gramscian perspective, then, although the problematic framing of female athletes is justified by dominant gender ideology, these commonsense beliefs can be undermined through alternative narratives. Such discourse is often called "counterhegemonic" because its expression could destabilize the very power structures kept in place by the institutional communication of dominant ideology (Hall, 1985). Examples of counterhegemony are not limited to mass communication texts; rather, resistance to dominant ideology can also be practiced by individuals who reappropriate dominant messages in ways that differ – or blatantly challenge – the creators' intent (Lull, 1995). Thus, sports media practices should not be considered static, but rather sites of possible resistance, a point that is especially attractive to feminists who are concerned with change and may appreciate the roadmap to change that a hegemonic perspective on power offers (Pringle, 2005).

Scholars have also documented various counterhegemonic narratives, suggesting that continued pressure on those in power may result in shifts that could be beneficial to women. For instance, Hardin, Lynn, and Walsdorf (2005) pointed to *Real Sports Magazine* as one example of counterhegemony in practice; the magazine frequently featured female athletes in team sports and exerting strength, images that directly contradict traditional gender roles. Other research has shown that female athletes may be receiving the most ethical coverage from students via campus media; as one study showed, college newspapers often lack the sexualized and passive images of female athletes that so often dominate other sports media (Huffman, Tuggle, & Rosengard, 2004). The authors suggest that the improvement in coverage may help the public understand the scope and success of women's sports – and thus lead to shifts in how women's sports are valued.

Although these differing depictions represent possible gains for women, feminists suggest that such challenges are but one small step forward and argue that continued pressure on those in power is still needed; these feminists have offered various prescriptions for change, including pressuring those in gatekeeping positions to rethink how dominant ideology may shape the messages they disseminate. For instance,

troubled by the coverage produced by the NCAA, an organization dedicated to the promotion of women's sports, Shifflett and Revelle (1994) have called for those working in sports organizations to develop a "conscious effort" to "get beyond stereotypes and to highlight the athletic element in female athletics" (p. 149). Others have sought to challenge dominant ideology within sports organizations and practices, such as advocating for the recasting of sporting values outside capitalistic frameworks. Doing so would undermine the logic that values sports – particularly football and men's basketball in a collegiate setting – because of their ability to make money (Suggs, 2005).

Feminism and Our Research on the Sports/Media Complex

In the previous review, we have aimed to summarize the ways radical feminists, and, to a lesser degree, feminists with a more liberal orientation, have framed the problem relating to coverage of women's sports. Scholars and advocates using these critiques have been instrumental in furthering the prospects for female athletes. Title IX, which has undoubtedly been the most influential development in relationship to women's sports in the modern era (if not *ever*) is a liberal feminist initiative, and, as we have also suggested, radical theory has guided critique of the sports/media complex by most well-known feminists in the field, such as Kane, Duncan, and Messner, among others.

Although liberal and radical feminists conceptualize the role of sports institutions differently – liberal feminists generally stress similarities between women and men and do not interrogate masculine ideology in sports institutions, as do radical feminists – they situate power similarly, as a top-down force exercised by the few over the many. It logically follows, then, that their prescriptions for improved representations of women's sports would share similarities, including an agenda for activism in which women share a common understanding of the oppressive nature of traditional gender roles and of their shared exploitation *vis-à-vis* media representations where they are marginalized or depicted in hyperfeminine ways. Simply put, the sports-feminist agenda for change has generally relied on universal agreement that women as a collective have been wronged, and on a singular understanding that the evidence of that oppression can be found in mediated representations of sports.

Our own research over the years has been a blend of liberal and radical theory and has generally assumed the same Gramscian orientation, integrating the idea of cultural hegemony to position women and female athletes as oppressed. We – along with the majority of sports feminists – have asserted that until masculine values are no longer privileged in the sports/media complex, women's inclusion in sports media will be perceived as illogical or unnecessary by both sports media producers and

consumers. We have asserted that deconstructing ideology that makes women's acceptance seem unnatural would open the door for women's general inclusion in sports media texts and for their acceptance as "legitimate" athletes and sports media professionals as well (see, for instance, Hardin & Shain, 2005; Whiteside & Hardin, 2008).

We have made this argument through research that has examined media texts such as newspaper sports sections and magazines (Hardin et al., 2005; Hardin, Lynn, Walsdorf, & Hardin, 2002); probed the experience, values, attitudes, and beliefs of women and men who produce the mediated texts (Hardin, 2005; Hardin & Shain, 2005, 2006; Hardin & Whiteside, 2009a, 2009b), and explored the values and motivations of sports fans who consumed these texts (Hardin & Whiteside, 2008; Hardin & Whiteside, 2009c). Perceptions and the framing of Title IX have been of special interest to us, as we see this law as essential to the rights of girls and women to participate in sports, and we recognized media framing of the law as influential on its public support. We have analyzed media texts that have questioned the logic of Title IX and have situated the comments of male and female consumers and athletes who have also questioned its logic within the framework of masculine hegemony (see Hardin, Simpson, Whiteside, & Garris, 2007; Hardin & Whiteside, 2008, 2009c; Whiteside & Hardin, 2008). In doing so, we have asserted that an ideology that privileges men and boys has become so "commonsense" that it could ultimately threaten protection of the law. In doing so, we assume a singular interest for women: the preservation of Title IX. A Gramscian lens for this research was logical and, we believe, consistent with the goals of the law itself.

Representations of Female Athletes

We have also, as have other sports feminists, considered the vexing issue involving the nature of (hyperfeminized and sexualized) depictions of female athletes. We have done so through analysis of texts, discussions with media gatekeepers, and conversations with athletes themselves. Here – faced with the contradictions we outlined earlier – we have begun to reconsider our feminist orientation as we have grappled for ways to reconcile arguments that certain images of athletes are ultimately oppressive with the opposition to these arguments from athletes and from others who identify themselves as women's sports advocates.

The genesis for our self-examination was in our analysis of transcripts of interviews with female college athletes and with bloggers who cover women's sports, in separate, ongoing projects, about the portrayal of sportswomen (for the most recent published work from these projects, see Hardin, 2011). We also grappled with alternatives to Gramscian-oriented understandings of power in interviews with women who work in college sports public relations. In all three of these projects, we found it difficult to situate the ways these women described themselves and their attitudes, values, and beliefs within the framework we had used before. We were confronted

– in ways we had not been previously (or, perhaps more likely, had failed to see) – with understandings of agency, empowerment, and difference among those we interviewed; the *contradictions* could not be satisfactorily explained within the framework of hegemony, and traditional second-wave approaches that generally assume monolithic interests in relationship to women and the sports/ media complex simply lacked the analytical power we needed to understand and explain those contradictions. Thus, we turned to a Foucauldian, poststructuralist (third-wave) perspective, driven by a different understanding of power and resting on alternative assumptions about difference and agency.

Foucault and Feminism

The work of philosopher Michel Foucault (1926–1984), especially his suggestions about how *power* works on a cultural level, has been influential in a number of fields, including inquiry about sports and the way sports are mediated. Foucault’s ideas about power provide a contrast to Gramscian notions about hegemony. A growing number of scholars have found Foucault a useful impetus to “ask new questions, think differently and allow for the creation of new understandings and possibilities,” as scholar Richard Pringle has asserted (2005, p. 273). Sports sociologist David Rowe has also argued that Gramscian approaches in sport theory have (rightly) been challenged in recent years by Foucauldian-driven poststructuralism (Rowe, 2004). Yet, as we will explain, sports feminists, especially those assessing mediated representations of female athletes, have been slow to integrate poststructuralist ideas into their work.

Key Concepts

Foucault argued in his voluminous work that the nature of power had evolved from a top-down, pastoral model to one where power is expressed relationally and through discursive frameworks. In other words, Foucault rejected the idea that a handful of groups or a class of individuals wield power over another (powerless) group or class (Foucault, 2003). Instead, Foucault saw power as constantly deployed among individuals at all levels of society through discourse. Discourse circulates those ideas we understand as “truth” (knowledge); thus, power and knowledge are constantly at work. The daily discourse between people produces social realities, and the effects of that discourse can be dominations such as sexism or racism (Markula, 2003).

Foucault (1995) uses the prison panopticon to illustrate the way individuals collectively participate in expressions of power. The panopticon is a literal prison structure that includes one central watch tower in the middle of a series of prison cells; prisoners can see the watch tower at all times, which creates a sense that the gaze is alert and everywhere. The effect is the belief of inmates that they are under watch for certain behaviors understood as morally acceptable (or not). Foucault argues that good discipline is a figurative panopticon and a discursive focus on the deviant subject produces discourses that define the “legitimate” and “normal” subject – in short, the

normalization of bodies. Language then becomes less about personal expression and more of a means through which identity is constituted and meaning is made. This process is what Foucault (1990) calls the power struggle against subjectification and that which ties an individual to him/herself and becomes known to others. Foucault is thus able to reject binary/essentialist judgments – clear categorizations of the “liberatory” and “repressive” (which necessarily must be dispensed when power is not seen as wielded like a hammer). Thus, a Foucauldian perspective requires careful consideration of the cultural conditions of given practices because a discourse/practice designed in one context to be liberating can – and often is – repressive in another, and vice versa (for more on this, see Markula, 2003; Thorpe, 2008). Even those social movements designed to fight oppression – the feminist movement, for instance – amass power and then, in turn, can become guilty of their own forms of repression by their insistence on certain forms of knowledge as “truth.” Foucault, then, was far more interested in individual ethical development and its expression through discourse (a concept he called “technologies of the self,” which we will discuss later) than in the formation of mass movements based on monolithic definitions of groups and attempts at context-free assertions of “truth” (Foucault, 2003).

(Second-Wave) Feminist Resistance to Foucault

Foucault’s assertion that all exercise power, his refusal to recognize an oppressor/oppressed binary or the need for organized social movements to fight institutions deemed repressive, and his resistance to recognizing essential identities (such as “woman”) have made him controversial among second-wave feminists (Hardin, 2011). Further, a roadmap for change with a specific locus of power at which to direct attention is absent, making poststructuralism seem problematic for feminists (McWhorter, 1999). To summarize the book-length critiques of Foucault written by feminists over the years, his work is seen as a threat to the vision of (second-wave) feminists of the movement as being one with unified goals and a moral imperative to lift women from underneath oppressive ideologies and cultural norms.

The truth, however, is that feminism has never been a singular movement – and, for that matter, neither has sports feminism. We have pointed to basic differences between two theoretical branches of sports feminism (liberal and radical); there are many more (Birrell, 2000). Sports feminists have relied on assumptions about what women want from the sports experience, for instance, and how those experiences impact their lives. We include ourselves here: those who study the sports/media complex have often assumed certain (liberatory or oppressive) motives and outcomes based on a theoretical foundation (Gramscian) that has encouraged such conclusions. From this viewpoint, women are always positioned as oppressed, even when they might protest that they are not. As noted feminist scholar bell hooks (1984) asserts, shared victimization is a destructive foundation for feminists because, at least in part, it fails to resonate with the mainstream experiences of many women. Further, hooks

suggested that a far more appealing and powerful identity for women to share is built “on the basis of shared strengths and resources” (p. 46). This seems to mesh with poststructuralist/Foucauldian notions of power, which would encourage feminists to abandon the notion of universal unity and instead use difference as a resource. Poststructuralism resists universal explanations and a binary model (e.g., dominance/oppression, powerful/powerless) and gears judgments to specific contexts. Thus, it allows for the inevitable contradiction that arises from the fact that all women (and men) are not the same, and that their desires, understandings, and experiences are not the same. From that perspective, it becomes a workable theoretical tool for examining issues such as the representation of female athletes in ways that are not palatable to some women’s sports advocates while perfectly acceptable – indeed, empowering – to others. We point to the work of Thorpe (2008) as an example of a critique of representations from the poststructuralist viewpoint.

Thorpe (2008) is not the only scholar who has moved away from traditional feminisms in assessing the sports/media complex, as we discuss below. Such an approach, however, is still met with resistance by sports feminists. In an article published in a leading journal in the field, two scholars (Edwards & Jones, 2009) argue passionately that poststructuralism poses a threat to the work of feminists and critical scholars because of its lack of an ethical foundation (failure to assert universal moral imperatives). At the same time, however, they acknowledge that poststructuralist feminists ultimately *do* use moral judgments in their work – from the choices they make about their objects of study to their choices about what artifacts to ignore or magnify in their analyses. It is not that poststructuralist sports feminists fail to make judgments; it is that they do so with a greater emphasis on context and a different understanding of power and agency in those judgments. In the context of studying mediated depictions of sportswomen, sweeping generalizations are not possible.

Foucault and Our Feminist Analysis of the Sports/Media Complex

Increasingly, women’s sports activists are recognizing the limitations of second-wave feminisms, which tend toward Gramscian understandings of power and resistance, in grappling with the complex issues involving depictions of female athletes. Increasingly, influential sports feminists are incorporating Foucault, finding value in his ideas about the role of the body in discourse and power relations. For Foucault, the body is central in the mechanisms of discourse and power, and this focus has evoked attention. Cole (1993), for instance, responding to the struggle commonly articulated by feminists over control of women’s bodies (such as the common critique of the sexualization of female athletes), has urged sports feminists to resist assumptions that situate the body outside of cultural practices. Instead, she advocates working toward demystifying how the gendered docile body is constituted. One manifestation of this call is Duncan’s (1994) work on the production of the feminine

body. In analyzing *Shape* magazine, she showed how the discourse of personal motivation disguises normative messages about complying with a feminine ideal. Thus, when women are told in the magazine to make a "solemn promise to yourself" to get fit and look like the (photoshopped) cover models, they begin a process in self-monitoring and self-surveillance to meet a normative standard. The focus on how discourse obscures how bodies are normalized has been a common trope in post-structuralist analyses. Similar to Duncan, Schultz (2004) examined media coverage stemming from Brandi Chastain's famous "sports bra moment" following the 1999 women's soccer World Cup and argued that through discourse that situates the sports bra as a symbol of agency and empowerment, women are invited to engage in body management that results in a specifically feminine docile body. Others, such as Caudwell (1999), have considered how power is expressed through everyday discursive frameworks in which we are all implicated. Using questionnaires and interviews with female footballers in the United Kingdom, Caudwell discussed how engaging in an activity marked as "male, affects a player's subjectivity, in particular, their gender identity" (1999, p. 400). Cole (1993, p. 86) calls this process an effect of the "technologies of sport" or an "ensemble of knowledges and practices that disciplines, conditions, reshapes and inscribes the body."

In his later work, Foucault began focusing on how individuals may use what he called technologies of the self to engage with normalizing power relations. In short, technologies of the self refer to the method Foucault suggested for the ways individuals might "practice freedom," as he called it, and challenge or change dominant discourses. The practice involves ethical self-care, critical and reflexive thinking, and the writing process ("self writing," he called it) in the transformation of everyday practices. What is critical, and is explained by Markula (2003), is that this process cannot be judged from the outside. In other words, how freedom is practiced by one individual in one context would be different from that practiced by someone else in another context. For instance (getting back to the "vexing issue" we introduced at the beginning of this chapter), it is perfectly legitimate for a female athlete to argue that posing in a way that accentuates her sexual attractiveness is a practice of freedom for her; it is also legitimate for women's sports advocates to decide to reject these depictions as their own technologies of the self. The central issue is not the *act* but the *motive*: for instance, if a female athlete poses because she feels she needs to conform to "hetero-sexy" standards, she is most decidedly *not* free, and nothing is gained. To allow technologies of the self to serve us, we must be willing to ask questions, accept the answers, and accept difference. We must also abandon a one-size-fits-all approach to activism, as this advocates a one-step-at-a-time, multiple-answers-are-right understanding. In doing so, we must also recognize that liberation is not marked by a clear path led by individuals who "know" better.

Thorpe (2008) offers an apt application of these ideas in her work addressing how technologies of the self are employed by female snowboarders. While first illustrating how female snowboarders are essentially objects of power relations – produced through discourse similar to the arguments offered by Duncan (1994) and Schultz

(2004) – she then situates the women as subjects, active in engaging in the process of “what seems ‘natural’ and inevitable in their identity” (Thorpe, 2008, p. 210). In talking with the interview participants about the sexualization of female snowboarders in media, Thorpe noted how many of them enjoyed the sexualized gaze of men. Further, many did so from a critical perspective, thoughtfully weighing competing versions of femininity to imagine new ways of “being.” As Thorpe writes, “In so doing, these women are able to effectively negotiate discursive constructions of femininity that might otherwise limit their subjectivity” (p. 215).

Our interviews with bloggers who cover women’s sports – a lonely avocation in a blogosphere dominated by discourse that belittles female athletes – are a case study in how technologies of the self could be applied to an analysis. Using Thorpe’s (2008) work as a model, we sought to understand how members of a blogging collective about women’s sports, whom we situated as advocates by virtue of their willingness to publicly declare their fandom, understood hyperfeminized images of female athletes. We used a recent artifact – *ESPN the Magazine*’s “Body Issue” (published in fall 2009 as an alternative to *SI*’s swimsuit issue) – to initiate conversation, as a number of the bloggers we interviewed had written about the magazine.

Some had criticized the images of scantily clad female athletes, while others had praised them. In our interviews, we asked bloggers to tell us about their beliefs and motives, helping us to understand why they chose to promote or condemn the images. What we found was that while some bloggers had not engaged in reflexive thought aimed at ethical self-care, most had done so – no matter where they publicly came down on the issue. Furthermore, they appreciated the different points of view expressed in the collective, seeing all as valid. By applying this Foucauldian concept, then, we were far better able to get at the (contextual) truth about this collective. We saw *power* at work, and we situated our participants neither as victims of false ideology nor as failing to meet a universal standard for women’s sports advocacy (Hardin, 2011). Ultimately, we recognized the power in this blogging collective to advocate for women’s sports in diverse ways, with the potential to reach out and connect across a spectrum of subjectivities and drive discourse forward in new and previously unrealized ways.

Conclusion

In this overview of theoretical perspectives and our evolving work on women and the sports/media complex, we do not mean to suggest that research and activism grounded in second-wave feminisms or in Gramscian notions about power is without value; quite the contrary. The notion of *masculine hegemony* in understanding and explaining the nature of sport and its mediated representations is essential for sports feminists – and, in fact, for any scholar who is serious about critically studying the relationship between sports and culture. Furthermore, we believe – and have

suggested – that our research on the relationship between media gatekeepers, texts, and sports fans relating to Title IX has been well served by a Gramscian perspective.

We suggest, however, that emerging feminist scholars thoughtfully consider the assumptions about the relationship between sport, gender, and power in their research and consider how a poststructuralist approach may ultimately be more satisfying and useful in reconciling the contradictions they will inevitably encounter. As with any theoretical approach, a poststructuralist framework will draw critique. However, we strongly assert that such critique should not be on the grounds that such an approach is a threat to the moral judgment inherent in feminism; again: quite the contrary. Instead, we have felt a greater moral weight on *ourselves*, as researchers, to carefully consider all perspectives, to contextualize our understandings, and to examine our assumptions and assertions as researchers. The words of leading Foucauldian feminist Pirkko Markula (2003, p. 105) are our guide: “As players in the sporting truth game, we need to reflect on the limits of our own identities [...] Only then can we use our knowledge and our power positions ethically.”

NOTES

- 1 Jhally (1989, p. 70) coined this term to capture the symbiotic relationship between sports industries and the mediation of those sports industries. The relationship is highly interdependent and mutually reflective.
- 2 We use the term “poststructuralist” in the same sense as “postmodern.” The terms are often used to mean the same general approach to power, agency, and identity. Sometimes they are used interchangeably, such as by Hall (1996) and Mann and Huffman (2005). For an explication of the features of postmodern critiques of sport, see Edwards and Jones (2009); their explanation of postmodern critique is parallel to descriptions of Foucauldian/poststructuralist theory as found in Markula (2003), Macleod (2006), and other texts.
- 3 Examples of our work that draws from a Gramscian perspective include Hardin, Simpson, Whiteside, and Garri (2007); Hardin and Shain (2005, 2006); Whiteside and Hardin (2008); Hardin, Lynn, and Walsdorf (2005).

China's Media Transformation and Audience Research

Hongmei Li

ABSTRACT

This chapter reviews Chinese audience research in the broader context of social, cultural, and media transformations that took place in China in the past three decades. It first describes some of the lasting structural changes that have altered Chinese media industry and Chinese society, such as foreign media influence, commercialization, and China's entry into the World Trade Organization in 2001 – developments that, to a great extent, have shaped the way in which audiences are conceptualized and studied in China. It then analyzes influential audience studies in order to examine key themes and patterns, with a specific focus on the shift in the status of Chinese audience members, from subjects and primarily citizens of the nation to consumers in a capitalist marketplace. The chapter reviews research conducted by scholars interested in cultural studies, ethnography, and new communication technologies, seeking to identify gaps in the knowledge of Chinese audiences. It explains what still needs to be explored in the field of audience studies in China; and it ends by offering an agenda for future research.

In his book *The Post-American World*, Fareed Zakaria, *New York Times* bestselling author and editor of *Newsweek*, argues that, while the US remains a superpower militarily, “in every other dimension – industrial, financial, educational, social, cultural – the distribution of power is shifting, moving away from American dominance” to “the rise of the rest” (Zakaria, 2008, pp. 4–5). Such a power shift is characterized

in particular by the rapid ascent of China and India as the next two superpowers, which now share a long list of the world's biggest, largest, tallest, and richest. Zakaria presents an interesting analysis of the political implications of "the rise of the rest" and writes about how the US can no longer ignore other ascending countries such as China and India. Despite increasing economic, social, cultural, and political ties between these two Asian countries and the US, as Parameswaran (2009) has rightly pointed out, there is still "relative silence in the US communications academy on what these geopolitical developments mean for our field." Acknowledging the urgency of studying major shifts in the global geopolitical and economic orders, this chapter focuses on the exploding media industries in China in response to Parameswaran's call to promote more outward-looking and comparative modes of international communication research in the US communications academy.

Chinese media have experienced exponential growth in the last three decades, after China started its economic reforms and "open-door" policies in 1978. Traditional media such as newspapers, magazines, TV, and radio developed rapidly from the 1980s to the late 1990s, and the last decade in particular has witnessed tremendous development in new communication technologies such as the Internet and the mobile phone. While China had only 32 television stations and 93 radio stations in 1978 (Chan, 1994), the number of TV sets increased to 317 million in 1997, with a penetration rate of 86.2%, and the number of radio listeners reached 725 million in 2002 (Chen, 2008). The penetration rates of TV and radio have now reached 96.6% and 95.4% respectively (SARFT, 2008a). China's cable TV households increased to 153 million in 2007, and the penetration rate was 40% (SARFT, 2008b). In 2007 there were 578 book publishers, 1,938 newspapers, and 9,468 magazines in China (GAPP, 2008). The number of Internet users in China reached 513 million by 2011, and the penetration rate stood at 38.3% (CNNIC, 2012). Since 2008, China has surpassed the United States and has become the world's largest Internet population. China now has more than 800 million mobile phone users ("China's Mobile Phone Users," 2010).

China's media have expanded against the backdrop of rapid economic development. After three decades of double-digit growth, China recently surpassed Japan and become the world's second largest economy (Barboza, 2010). China's economy was estimated at 1.33 trillion US dollars and its gross domestic product (GDP) per capita reached 3,600 US dollars in 2010, from 400 US dollars in 1978 – a nonuple increase in three decades (Deng, 2009). China has already become the US government's largest creditor, and is estimated to overtake the United States and become the largest world economy in 2030 (Barboza, 2010). Chinese economy is characterized by huge gaps between the rural and the urban, between the east coast and western inland areas, and between the rich and the poor. While average disposable income for urban residents in 2010 was 9,757 Yuan (about 1,460 US dollars), the cash income for rural people was 3,078 Yuan (approximately 460 US dollars), less than one third of the average amount for city residents ("China's reports income increase," 2010). The GDP per capita for Suzhou, China's canal city and Shanghai's neighbor, for example, reached 25,500 US dollars in 2009, seven times the country's GDP per

capita (Cox, 2009). An article in *Fortune* magazine reported that the richest 20% of China's population were estimated to control more than 80% of the country's wealth. The World Bank estimates that more than 400 million live on less than \$2 a day (Chandler, Wang, & Zhang, 2004, p. 152). Liping Sun (2003), a prominent sociologist, views China as a "fractured society," and another well-known scholar states that China has developed into "four worlds" (Hu, 2004). China's Gini Coefficient, an indicator that measures inequality in wealth distribution, has reached 0.47, which has surpassed the well-recognized warning line of 0.4 in the international community (Chen, 2010).

The purpose of this chapter is to situate audience research in the broader context of China's social, cultural, and media transformations of the past three decades. The chapter first analyzes some of the lasting structural changes that took place in the Chinese media industry – media importation, media commercialization, global influences, and commoditization of audiences – and in Chinese society, which have shaped the way audiences are conceptualized and studied in China. The descriptions of these structural changes set the stage for my subsequent summary of existing audience research. I then selectively review some influential publications on media audiences in China, in order to analyze key themes and patterns in this body of work and to identify the scope of what has been studied and what is still missing in this research. Having explained and outlined the gaps in our knowledge of audiences at this historic moment in China's altering media environment, the chapter ends with an agenda for future research.

Research on China necessarily requires a few words on how the author approaches this nation's disputed political boundaries. While China in a broad sense can include mainland China, Hong Kong, Taiwan, or even the Chinese diaspora from a cultural perspective, this chapter focuses on mainland China. In reviewing studies on audiences, I limit myself here to research published in Chinese and English that has addressed media in mainland China. Researchers reviewed include scholars in mainland China and Hong Kong, ethnic Chinese scholars residing in the West (predominantly in the US), and foreign scholars in English-speaking countries who have taken an interest in China. My choice here to foreground mainland China means that Chinese media audience research published in other major languages is not included in my review. Nevertheless, my selective discussion still aims to provide insights into the emergent field of audience studies in China and strives to chart the boundaries of the still unfolding trajectory of research in this area.

Importation of Foreign Media Products in the 1980s and Early 1990s

In order to look at media audiences in China, we have to first examine the development of Chinese media, which has been intertwined with China's efforts to globalize

its economy from the very beginning, when China started to implement its open-door policies in 1978. In 1979 Deng Xiaoping visited the United States and signed a package plan for cultural exchange between the two countries. Since then, Chinese media workers cautiously but actively sought to introduce Western media programming in China. *Man from Atlantis*, a short-lived US science fiction TV serial of the National Broadcasting Company (NBC), was the first US TV program imported to China. The show was very popular among Chinese audiences, and the sunglasses worn by the hero Mark Harris (starring Patrick Duffy) became the absolutely necessary gadget for fashionable Chinese youth then (He, 2007). *Garrison's Gorillas*, produced by the American Broadcasting Company (ABC), was the second American TV serial that aired in China. In the 1980s China also aired other American TV series: *Hunter*, *Falcon Crest*, *Remington Steel*, *Matt Houston*, and *Dynasty* (Lu, 2000). China imported the first foreign cartoon, Japan's *Astro Boy* series, in 1981; since then, a large number of foreign cartoons have entered the nation. In 1991 Shanghai TV Station broadcast *Growing Pains*, an ABC family sitcom, and this show enabled Chinese parents to see, for the first time, that they could be friends with their children rather than authority figures. *Growing Pains* was broadcast for four consecutive summers. While there were no official statistics on the global audience reception of the show in China, according to Zhang Xin, who dubbed *Growing Pains* into Chinese, "[a]ll people I knew, ranging from elder women in our neighborhood, to co-workers, to primary school children, asked me about the next plot after each previous episode was broadcast" (He, 2007). Since then, many more foreign programs have been aired in China. Despite the popularity of foreign media programs and a general pro-Western attitude among the educated elites, however, Chinese media workers were then under a lot of social and political pressure, because they ran the risk of being accused of spreading capitalism and capitalist lifestyles. Capitalism was constantly condemned in official media and by conservative government officials, which created a deep sense of uncertainty.

In the 1980s, an unprecedented "cultural fever" appeared in China, which was accompanied by the publishing of a large number of translated works on the West, imported Western media, and cultural products and by critical reflections on Chinese traditional culture. The educated elites in China yearned for Western democracy and critically reflected on Chinese tradition and history. Some popular media programs symbolized their tensions with the official ideology of the time and their sense of anxiety toward China's future. A telling example was a 1988 TV program entitled *River Elegy* (*He Shang*), which sharply criticizes Chinese culture and civilization by reinterpreting long-standing Chinese symbols: the Great Wall, the Yellow River, the Dragon, the Red Flag, and many other Chinese icons. While *River Elegy* portrays the "azure blue civilization" of the West as symbolizing "youthfulness, adventure, energy, power, technology, and modernity," the "yellow land culture" of China is described as decadent, incompetent, superstitious, lifeless, and outdated (Chen, 1995, p. 31; Chen & Jin, 1997). This controversial television show only aired twice, in June and August 1988, and was later banned by the Chinese government; but it was extremely influential. Practically every Chinese citizen with TV access watched this program.

After the TV show was banned, handwritten manuscripts of the book were circulated among high school and college students. Also, the government encountered a legitimacy crisis, which was largely due to China's reflections on its own Cultural Revolution (1966–1976), on the history of its Communist Party, on its past propaganda, on the problems that occurred during the economic reforms, and especially on the Chinese government's crackdown on the Tiananmen student democracy movement in 1989.

Rapid Media Commercialization in China since 1992

The controversy that ensued after 1989 deepened the crisis over the legitimacy of the Chinese Communist Party. Consequently the government turned toward economic development, intending to consolidate and maintain its authority. In 1992 Deng Xiaoping, architect of China's reforms, toured southern China and called for officials and entrepreneurs to take bigger and bolder steps toward developing the whole country. Deng's aphorism – “it doesn't matter whether a cat is black or white, as long as it catches mice it is a good cat” – was commonly cited to show his cool head and utilitarian way of viewing ideological differences. Since then, Chinese media have commercialized their operations with great speed and have openly embraced transnational and Chinese private capital.

While in the pre-reform era Chinese media were pure propaganda tools for the government, now they have to serve two masters simultaneously: on the one hand they are mouthpieces of the state party; on the other hand they have to earn money for their own survival (Zhao, 1998, 2008). Lee, He, and Huang (2006) further point out that Chinese media have been transformed into a “Party Publicity Inc.” and have become a “quasi-business that seeks to make huge profits on the one hand and to legitimate Party mandate by promoting its image on the other” (p. 1). Since 1998 the Chinese government has stopped subsidizing the Chinese TV industry. The termination of subsidies and the increasing competition have forced the media to seek partners and to find other financial means of funding their content production and distribution. Seeking advertising money has become a natural choice. Except for a few party organs, Chinese media now rely exclusively on advertising funds, sponsorship, and subscription fees for survival. Some media obtain more than 90% of their yearly revenues from advertising (Zhao, 2008).

The increasing importance of advertising is also reflected in China's double-digit and sometimes triple-digit advertising growth in the last three decades. In 1981 the country had slightly over 1,000 advertising operation units – advertising agencies and media organizations such as newspapers, magazines, radio, television stations, and outdoor media – that were licensed to carry advertising; but that number reached more than 172,000 in 2007. The number of people employed in the industry also increased, from slightly over 16,000 in 1981 to over 1 million in 2007; and the yearly advertising revenue increased from 118 million Yuan in 1981 to over 174 billion Yuan

in 2007 (Li, 2006; Lu, 2009). The market value of the Chinese media industry – which consists of advertising, broadcasting, cable TV, publishing, movies, and entertainment markets – reached 50.5 billion US dollars in 2009; this figure put China in the third place, next only to the United States and Japan (Datamonitor, 2009). Broadcasting and cable TV represent the largest and quickest growth. Revenue generated by the broadcasting and cable TV segment made up 48.2% of the Chinese media market value in 2009 (ibid.).

Foreign advertising entered the Chinese market right after China started its economic reforms in 1978. Foreign companies relied on slick image-oriented advertising, and foreign products had been advertised in China even before they were available there. Japanese and American advertising firms were the first to explore opportunities to expand their business in this country. Foreign agencies began to enter the Chinese market on a large scale in the 1990s. By the end of 1994, almost all the top ten transnational advertising agencies had established joint ventures in China (Li, 2006). While then foreign advertising firms were required to establish joint ventures with Chinese partners and were only allowed to maintain up to 49% of the shares, now they can own their operations in entirety.

China's demand for foreign capital and management expertise opened the door for transnational capitalists to enter the Chinese market through limited channels. Large book publishers such as Bertelsmann, McGraw-Hill, Pearson Publishing and Simon & Shuster have long established collaborations with Chinese publishers. Chinese magazine publishers have also actively sought cooperative ventures with foreign publishers. For example, fashion magazines such as *Elle*, *Cosmo*, *Rayli* (a fashion magazine founded by a Chinese and Japanese publisher), and *Vogue* already have a big presence in China.

Rapid media commercialization also led to gradual media fragmentation in China. Since the late 1990s, China has launched various movements to consolidate media. Actively supported and sometimes required by Chinese authorities, some media companies have merged to form larger companies within single media industries, and others have pursued mergers across media platforms. The conglomeration of media groups is, on the one hand, a measure designed to increase the competitiveness of Chinese media by anticipating foreign media's flooding into the Chinese market after China joins the World Trade Organization (WTO); on the other hand, it can also be seen as a way for the government to exert further control over the media in the context of the latter's fragmentation (Zhao, 2000, 2008).

Global Influences on Chinese Media in the Post-WTO Environment

China entered WTO in 2001, which led to many structural and institutional changes in the Chinese media industry. For example, China doubled the quota of foreign films

from the original 10 in 1994 to 20 in 2001 ("Foreign Films 'Would Boost Economy,'" 2009). China has recently agreed to obey a WTO ruling and to increase the import of entertainment products by March 2011 (Reuters, 2010). This ruling means that more entertainment products will enter China in the future.

Complex networks for the co-production and co-financing of films have become more and more common in China's film industry. Even though in 2008 China created a record 406 feature films and the box-office revenue increased 30% – to 4.34 billion Yuan (US\$ 638 million) – over 2007 and realized a continuous annual growth of 25% since 2002 ("Foreign Films 'Would Boost Economy,'" 2009), many so-called Chinese films were co-produced and co-financed, especially the big box-office hits. *Hero* (2003), directed by the famous Zhang Yimou, for example, was a co-production venture that involved mainland China, Hong Kong, and Hollywood (the US-based Miramax was a principal investor), and it featured a pan-Asian cast of highly bankable stars. *Hero* started the co-production trend; it was followed by Zhang's box-office success *House of Flying Daggers*. Feng Xiaogang's annual New Year comedy (*Hesui pian*) has also attracted major foreign investors like Columbia Pictures Film Production Asia, which distributed *Big Shot's Funeral* to the global market (Kong, 2007). His *Cell Phone* (2004) was a co-production with Columbia, and his *A World Without Thieves* (*Tianxia Wuzui*, 2004) was a co-production with Hong Kong-based Media Asia. Films produced by renowned Chinese directors such as Zhang Yimou, Feng Xiaogang, and Cheng Kaige received much of their profits from overseas exhibition (Kong, 2007; Wang, 2009). Exhibition in foreign countries has also become an important consideration for Chinese film directors, and some banned films have only been exhibited at foreign film festivals. Indeed Zhang's *Hero* (2003) and *House of Flying Daggers* (2004) were produced with international audiences in mind, and these productions had a mixed reception among Chinese critics and consumers, even though they were commercially successful (Wang, 2009).

The state and the transnational media corporations have formed strategic alliances in China in order to sell hybrid forms of popular culture to Chinese audiences. These hybrid media blend the slick modern aesthetics of global media with nationalistic pro-Chinese cultural content approved by the state authorities (Fung, 2008). Media groups such as Viacom, Disney, Times Warner, and News Corporations have long penetrated the Chinese market. Outdoor media groups such as Clear Channel, JCDecaux and Tom Group have already gained control over some of the most influential outdoor media firms in China.

In the TV industry, media restructuring measures were taken to separate the production of content from broadcasting (*zhibo fenli*), in response to the challenges that Chinese media face in the post-WTO era. Discussions about these measures reached their peak in 1999. The essence of this strategy was to break the administrative monopoly and to increase the competitiveness of Chinese TV stations while deepening the impact of market reforms. TV drama is the first arena through which private capital has been channeled into the Chinese TV industry. As the most widely watched TV genre, TV drama has grown at an exponential rate and has become a cash cow for

TV stations (Guangergaozhi, 2004; Wang, 2008). While broadcasting was suspended in 2002 for various reasons, in July 2009 the State Administration of Radio, Film and Television (SARFT) issued an official directive that reinvigorated the concept and practice of *zhibo fenli* (Ming, 2009). Now programs that are not closely related to politics or to sensitive issues, such as TV dramas, children's programs, entertainment programs, fashion shows, and sports, are grouped within the boundary of *zhibo fenli*, which means that a certain percentage of programming must be purchased on the market. Nevertheless, the government still maintains a tight control over the production of news, political commentary, and other sensitive programs (Ming, 2009).

Zhibo fenli can further promote entrepreneurship and private investment in the Chinese media industry, which has already been penetrated by private capital through advertising money, product placement, content transaction, sponsorship, and money from the stock market. The ongoing separation of media's political and economic functions has also been discussed in the Chinese media, as a form of preparation for the latter to be listed in the future on overseas stock markets – as has been the case for the Beijing Youth Media Group, which was listed in Hong Kong stock market in 2004, which was the first time for any Chinese media to be listed overseas.

Private capitalists and entrepreneurs can also collaborate with China's official media to host joint programs and co-produce TV programs for official media in China. For example, Yang Lan, China's Oprah Winfrey, a former China Central Television (CCTV) host and founder of a Hong Kong-based media organization Sunmedia, founded *Yang Lan One On One* (*Yang Lan Fangtan Lu*) with Shanghai Oriental Satellite TV, and she hosts it ever since. It is a program that specializes in interviewing well-known celebrities, sports stars, politicians, writers and cultural figures. Since 2004 Yang Lan also invested in *Women of the World* (*Tianxia Nuren*) and has hosted it with Hunan Satellite TV. Targeting young urban women, this talk show covers topics of life, family, and culture and competes with CCTV's *Half the Sky* (*Ban Bian Tian*). The financial capital of Sunmedia has been drawn mainly from private investment and from the stock market.

Developments in the Internet industry in China probably represent the ultimate possible convergence between foreign and domestic content. While Chinese authorities have been partially successful in censoring Internet content and in controlling access to foreign websites, Chinese Internet users have access, though a limited one, to foreign media content. And those with expertise in Internet use can bypass the Great Firewall to access censored websites and content. Even Twitter, which is now censored in China, has managed to attract a large number of ordinary Chinese users and activists.

Against the backdrop of media commercialization and global influences in China, the following section charts the landscape of audience studies and identifies a set of key concerns for future research in the field. I begin here with a brief review of the historical shift in conceptions about the prototypical Chinese audience, from those that represented it as made up of obedient and frugal citizens of an authoritarian state to those that put in front of us a picture of spectators of global media and insatiable consumers of a range of commodities.

Shifts in the Portrayal of a Chinese Audience: From Workers and Citizens to Consumers and Spectators

In the 1980s, the Chinese audience was largely understood as an undifferentiated conglomeration of citizens, situated in a historical relationship with the authoritarian state party and depicted as loyal political subjects. In this relationship the media were viewed as tools that could help nurture strong and close ties between Chinese citizens and the Communist Party (Chen, 2008; Liu, 2008). The main lens for looking at audiences so as to conceive of them was their political relationship with the state, and this representation was considered necessary for the state party to enact public policies efficiently and to disseminate its propaganda by having a better understanding of their needs. While the state party had historically relied on personal interviews and fieldwork to gather knowledge concerning “the mass” – that is, the population of China – the government and its agencies soon began to conduct large-scale scientific public polls in the 1980s. Research on media audiences, which was closely related to public opinion research, emerged in this context. During that period individual media organizations, which were part of the state’s propaganda apparatus, carried out systematic audience research in order to profile their viewers and readers, in a continuation of China’s propaganda model.

In April 1982 the News Research Institute of the Chinese Academy of Social Sciences, together with the *People’s Daily*, the *Worker’s Daily*, the *Chinese Youth Daily*, and the Beijing Broadcasting Institute (currently named the Communication University of China), conducted the first ever poll on audiences in Beijing, and it used the computerized random sampling method. Directed by Congshan Chen, this poll was designed to survey, among a host of other factors, audiences’ media exposure, content preferences, and perceptions of the media’s credibility (Chen, 2008). The survey also aimed to correct an over-politicization orientation during the Cultural Revolution (1966–1976) that treated class as the only criterion by which Chinese population was judged. In 1986 China held the first conference on media audience, and in the same year Renmin University founded the Public Opinion Research Center, which later became one of the most influential public opinion centers in China (ibid.). In 1987 CCTV conducted the first ever national media poll, in 27 provinces, aiming to map demographic and psychographic characteristics of audiences, their behaviors, and their media consumption patterns.

China’s clampdown on the Tiananmen student democracy movement of 1989 had a negative impact on media reforms and audience research (ibid.). Facing Beijingers’ cold reactions toward the regime, China conducted a large-scale poll to measure Beijingers’ opinions of the Asian Games in 1990. In April 1991 the Audience Research Commission of the Chinese Radio and TV Association was established, and it was the first academic organization to specialize in studying radio and TV audiences, training pollsters, hosting research seminars, and publishing original and translated works on audiences (ibid.).

Media commercialization since the early 1990s quickly changed the way in which the Chinese audience was historically conceptualized. After the liberalization of the Chinese economy, media audiences experienced their newfound status as commodities in the eyeball economy of increasingly capitalist media systems. The entry of large number of transnational corporations and of their advertising agencies spurred the acquisition of data about Chinese consumers, their lifestyle choices, behaviors, media preferences, and other information. Marketing firms began to conduct research about Chinese consumers. Horizon (Lingdian), China Mainland Marketing Research Firm (Meilande), and Sinomonitor (Xinshengdai) are among the most important Chinese polling firms established in the 1990s. Gallup China was established in 1991 as the first foreign survey research organization licensed to do business throughout China. Although China allows marketing firms to conduct survey research on consumer attitudes and behaviors, surveys on social and political issues are still highly controlled, and foreign polling firms are forbidden to conduct survey research on sensitive social issues.

The media rating system started to emerge in the 1990s. Advertising professionals such as Liu Guoji and the corporation Procter & Gamble (P&G) helped develop China's first set of television audience measurement protocols and standards. Two former P&G managers founded the first TV commercial monitoring company: Kangsai, whose English name was X&L, and which was later purchased by the Central Viewer Survey & Consulting Center–Taylor Nelson Sofres (CVSC–TNS Research, which is often shortened as CTR) company – a joint venture between CCTV and one of the largest global marketing firms, TNS. In 1997 CCTV and CTR jointly founded CVSC-Sofres Media (CSM), China's largest TV media monitoring company. Liu Guoji, who was working as the media public relations (PR) director at Zenith Media in November 1997, led a Chinese delegation – consisting of about thirty directors of TV advertising departments and TV station deputy directors in charge of advertising – in its visits to ABC, CBS, NBC, CNN, Fox, and the headquarters of P&G; the delegation was to learn about the advertising management models of these companies and to get trained in them (Liu Guoji, personal communication, 12 July 2005).

Media professionals gradually learned to measure Chinese TV and radio ratings by modeling their techniques after other countries' tools of audience assessment. CSM used people's meter, people's diary, and other means to monitor TV and radio ratings in mainland China and Hong Kong. A. C. Nielsen also established its operation in China; but it was much less influential, and its market share was between 10 and 20% in China. In 2009 Nielsen left the Chinese market, and CSM now monopolizes the Chinese TV and radio monitoring market. TV ratings have gradually become the most important criteria for a TV station to decide whether a program should be launched or continued, especially at a time when advertising has become the most important source of income. Companies that monitor print media and the Internet have also emerged. For example Hui Cong (www.huicong.com), established in 1992, now monitors more than 1,400 print media and more than 7,000 Internet sites.

Ethnic Chinese people from the diaspora who were trained in Western universities also began to be involved in training mainland Chinese researchers in survey design, sampling, and other issues related to survey research. Audience research in this sense emphasizes pragmatic application and media management and has little interest in theorizing, even though it has generated some of the richest data in Chinese media research (Liu, 2008; Hu, 2010). This kind of audience research stresses scientific positivism, and media scholars of this formation introduced and applied in China Western theories of media effects.

Understanding the Implicit and Explicit Audience: Textual Analysis and Ethnography

While media scholars in mainland China often emphasize positivist scientism in the study of media audiences (Hu, 2010), cultural studies scholars have engaged with audiences in quite a different manner. One group of scholars has approached the construction of audiences in cultural representations through textual and critical cultural analyses. One of the most prominent scholars in this camp is Jinhua Dai, a professor of comparative literature and cultural studies, who has founded the Center for Film and Cultural Studies at Peking University; and this is the first cultural studies center established in China. In *Breaking the Surface of History* (1989), Meng and Dai produced the first academic study that critiques Chinese women's literature; this study investigates the literature produced by nine prominent writers and uses textual analysis, historical analysis, and Marxist feminism. Dai's work *Gendering China* (2002a) examines the gendered culture of the 1970s and 1980s by analyzing how more recent Chinese women writers' narratives represent gender roles and imagine their communities of readers.

Dai's works encompasses feminist research, film criticism and cultural studies. Some of her recent work focuses on critiquing China's cinematic culture by reading film "not simply as a textual signifier in itself, or merely as a commercial or technological industry, but also as a cultural field scored by both elites and popular discourse" (Wang & Barlow, 2002: 4). Her work (1995, 1999a, 1999b, 2000, 2002a, 2002b) investigates how social forces – such as audience tastes and expectations – shape the content of popular texts such as films, advertisements, TV dramas, and other cultural forms. Dai has become the most important scholar in the field of cultural studies in China. She cannot be classified as an audience research scholar in media studies' more empirical traditions; however, her methodological approach, which combines textual analysis, historical analysis, and Marxist criticism, does fit into the broader realm of cultural studies and into its concern with reading/viewing publics. In a televised interview she has acknowledged her elitist stance in studying popular culture; there she stated that her lack of training in survey research, interviews, and fieldwork methods prevented her from studying audience reception (Dai, 2008). She has

explored instead how and why audiences consume popular cultural texts; and she has done so by interpreting the broader significance of these texts and by situating them in their broader social and historical contexts. Like Dai, other scholars (Larson, 1991, 1998, 2009; Meng, 1993; Barlow, 2004) critique literature, media texts, and popular cultural texts, aiming to understand larger issues such as modernity, feminism, sexuality, gender, and the nation. Taking an interpretative and interdisciplinary approach to media texts, these scholars, whose work crosses over into media studies, are identified with such fields as Chinese studies, East Asian studies, or comparative literature.

Wang (2009) is among the few communication scholars who have critically studied cinematic texts. In her case study, Wang looks at the complex interaction between Chinese cinema and Hollywood and at the reception of two films directed by Zhang Yimou – the most successful Chinese film director with an international reputation – namely *Hero* (2003) and *House of Flying Daggers* (2004) that used Hollywood production and narrative style and marketing practices. Wang argues that the reception of these two commercially successful films among Chinese critics and consumers – as indicated in reviews and other texts that responded to the films – was, at best, mixed, because Chinese audiences assessed them as films that emphasize cinematic style over cultural substance. Given the choice of catering for the tastes of a global audience or satisfying local cultural preferences, Zhang Yimou leaned toward the former (or so argues Wang) – which left Chinese audiences dissatisfied with the narrative content of these films.

Aiming to go beyond textual analysis and critical cultural studies, scholars with training in ethnographic research techniques have focused on audience reception of particular programs – especially on various tactics of resistance and negotiation – and on the changing relationships among viewers, texts, and media industries (Lu, 2000). Ethnography and the active audience achieved important status in cultural studies during the nineties, in the wake of Janice Radway's influential book *Reading the Romance*; this book contained ethnographic research that contested the normative perception of female readers of romance, in the US, as passive dupes of patriarchal popular culture texts (Lull, 1990; Ang, 1996; Lu, 2000).¹ As part of this larger tendency to pay attention to the responses of ordinary audiences to media culture, studies of the engagement of Chinese audiences with a vastly altered mediascape have also relied on ethnography, focus groups, and interviews.

Attempting both to transcend textual analysis, which treats texts as having closed meanings, and to overcome the idea that audiences have total autonomy in making meanings, anthropologist Rofel (2007), for example, studied the influential TV drama *Yearnings* (Ke Wang; 1990), and her ethnographic analysis moved back and forth between narratives of the TV drama and ordinary viewers' responses. By intertwining her critique of the drama's narratives with viewers' interpretations and critiques, Rofel treats media texts as open-ended and fluid narratives. Rofel proposes that viewers' disagreements and conflicts with the drama's narratives demonstrate that popular culture can incite larger discussions of citizens' changing expectations and

subject positions in postsocialist China. Similarly, another anthropologist (Friedman, 2006) studies audience responses to *Twin Bracelets*, a popular film that targeted Mandarin and Cantonese speakers in Taiwan, Hong Kong, and Southeast Asia. Friedman watched *Twin Bracelets* with her subjects and then compared their commentaries on the film with her ethnographic notes about their everyday work and family lives. Situating viewers within national and transnational contexts of media production and consumption, Friedman analyzes how these women's responses to the film revealed both their authorial agency as active spectators and their containment within existing structures of power, which were echoed in the film's narrative. Murphy (2007) draws on ethnographic fieldwork and on the textual analysis of state-sponsored official media products – a party-produced prefectural newspaper, *JA Daily*, and an anti-corruption film titled *The Life and Death Decision* – to examine how these pedagogic training tools are enlisted to help large audiences of official cadres understand and implement state policies. Murphy argues that these media products participate in the larger project of suppressing knowledge of the state party system's flaws and of discouraging political reform, which in the end results in poor governance.

Communication scholars in Hong Kong have produced some of the most interesting studies of Chinese audiences in the past decade, partially due to their geographic proximity with mainland China. These researchers, who were often trained in the West, have conducted ethnography and in-depth interviews with Chinese consumers/citizens in the broader context of global media flows, cultural politics, and media transformations in China. Hong Kong scholars such as John Erni, Eric Ma, Anthony Fung, and Laikwan Pang have authored extensive studies of audiences, media, and popular culture. I will comment here, however, only on a few of them, which focus on media culture in mainland China. Generally speaking, these studies can be categorized into research on youth culture (Erni, 2005, 2007, 2008; Fung, 2009), research on modernity (Pang, 2002, 2007), research on global media flows (Pang, 2002, 2007; Erni, 2005, 2008; Fung, 2008), research on regional media production and consumption (e.g. Fung, 2008, 2009), and research on issues of identity (Pang, 2002; Erni, 2007; Fung, 2009). For example, Erni (2007) studies the production and consumption of Cantopop and the “gender negotiations found in the production, the musical forms, and the consumption of Cantopop” (p. 87). Conducting interviews and focus groups with youth in Shanghai and Hong Kong, Erni has also investigated the reception of the *Harry Potter* phenomenon (Erni, 2005, 2008).

Fung (2008) analyzes the localization strategies of transnational media corporations in China and argues that Chinese audiences have embraced popular cultural forms that sell “blatant individualism, seditious independence, and above all, crude commercial values,” which cannot help nurture a public culture of social responsibility and civic society. Yet, in a more optimistic recent article on stardom in China, Fung (2009) also examines how Chinese fans responded to Faye Wong, one of the most influential pop singers in the country and outlines how Faye Wong's unconventional femininity challenges gender norms and provides the newly emergent middle-class

female base with a sense of empowerment. Fung combines textual analysis of Faye Wong's lyrics, persona, and images with ethnographic methods and in-depth interviews with fans in Beijing and Hong Kong.

Audience Research and New Communication Technologies

Communication scholars who focus on how the Chinese use new communication technologies, such as the mobile phone and the Internet, tend to stress the notion of active consumer and the blurring of the boundary between producers and consumers. Because a typical user of new communication technologies is generally young, urban, and educated, researchers working in this area often focus on the production and consumption of youth culture. For example, Wang (2008) devotes one chapter of her recent book *Brand New China* to youth culture and music marketing by analyzing Motorola's marketing campaigns. With a primary focus on music and mobile phone, Wang examines whether music is a major mechanism driving youth culture in China, and she concludes that Chinese youth are engaged in a safe yet cool phenomenon: on the one hand, they want to be different from others; on the other hand, they experience their coolness within boundaries that are socially acceptable.

Scholars who have studied Internet users address the issues of cyber-nationalism, activism, control vs. countercontrol, civil society, identity formation, and community building. Wu (2007), for example, examines the evolution of online nationalism from being an "ivory tower" issue to becoming a popular phenomenon in China, and he traces specific cases about cyber-nationalism by drawing on secondary data and interviewing key players. Li (2009) analyses controversial Toyota and Nippon advertisements in China and explores how netizens expressed overwhelming feelings of nationalism toward these ads. Yang (2009) analyzes the development of online activism in China by studying how the Internet has enabled the creation, formation, and shaping of contentious forms of public opinion. Analyzing how Internet forums are used as sites for the expression of conflict and control, identity-building, and community formation, Yang argues that the Internet has offered a limited platform for underdogs to organize themselves and to express dissent and a desire for social justice. The emergent civil society in China provides the cultural foundation for online activism, and some business organizations have also participated in producing and sustaining contentious forms and practices of public opinion.

With an interest in censorship and control, Esarey and Xiao (2008) examine how popular Chinese bloggers use subtle forms of political expression, such as satire, to criticize the state without facing political repression. Yu (2006; 2007a; 2007b) further states that online participation enables Chinese users to exercise forms of active citizenship. Yu (2007a) studies some cases of political and social parody in the Chinese

cybersphere, to argue that the Internet gives citizens a public platform for alternative expressions of dissent. Li (2011) interrogates how Internet users in some well-known *egao* ("spoof") cases have deployed parody to protest against state control and censorship of the Internet in China. Qiu (2009) studies, among many other things, how Chinese citizens from different socioeconomic strata gain access to information and use communication technology for different purposes. He thus inserts an important discussion of class into debates over the uses of information and communication technologies in China. Wallis (2008) examines how migrant young women in the low-level service sector of Beijing use mobile phones to negotiate the struggles they face in their daily lives and to create and sustain meaningful connections.

Most of the studies mentioned above are interested in notions of modernity, globalization, youth culture, identity formation, community-building, and civil society. The emergent middle classes – or in some cases the cultural elites – are often what scholars appear to be primarily interested in; which means that rural residents and elderly audiences are often excluded from their research projects. Wallis (2008) and Qiu (2009) study migrant workers and working-class people, but these less privileged populations are still located in urban spaces in their projects. Rural residents residing in the countryside have rarely been studied in media audience research, and the neglect of these marginalized citizens in academic work on audiences echoes their invisibility in China's market economy and commercial media spheres.

While communication scholars have played an active role in engaging with Chinese audiences' interactions with the new media, they still lag behind in producing knowledge about Chinese audiences' consumption of traditional media. While cultural anthropologists have led the way in using ethnography to study media culture as part of larger social and economic transformations, their focus is often on popular culture, namely cinematic texts and fictional TV programs. Recognizing the strengths and weaknesses of past audience studies in China, the following section will provide a tentative agenda for future research.

Agenda for Future Audience Research

In the mid- to late 1990s, there was a strong push in some quarters in the West to abandon media ethnography, and these critics lamented that audience studies often produce and repeat the boring mantra of active audiences (Parameswaran, 2003). Critics thus called for a return to media texts and political economy. What is missing from such critiques is the fact that audiences in large parts of the non-Western world have not been studied. As Parameswaran has pointed out, in the context of global capitalism, what we need now is a "renewed commitment to discovering global media's role in constraining and enabling progressive social-democratic practices" (pp. 311–312). Parameswaran (2001; 2003) is among the very few scholars who have conducted audience ethnology in developing countries; in her

case the location is India. Her research among young middle-class women in urban India who read Western romance fiction indicates that Indian women assert the superiority of Indian culture and simultaneously enjoy the privileges of Western media culture. Among Indian women, the reading of romance is closely related to discourses of patriarchy, nationalism, and modernity, which are of paramount importance to third-world countries and to the international community at large. Concurring with Parameswaran, I would argue that media scholars should be committed to in-depth ethnographic audience studies of China – an emerging superpower that is exerting an increasing amount of influence and is shaping the political and economic agendas of numerous communities in the world.

When studying Chinese audiences, scholars can start by paying attention to citizens' / consumers' interpretations, negotiations, and even contestations of TV dramas, which are the most watched entertainment genre. The subgenres of TV drama popular in China consist of "*lianxuju* (television serial), *tongsuju* (popular drama), *qingjieju* or *yanqing ju* (melodrama), *shinei ju* (indoor drama), *feizaoju* (soap opera), *xiju* (comedy), *qingjing xiju* (sitcom), *lishi ju* (historical drama), *wuxiaju* (martial arts drama), and *jingfeiju* (detective and crime drama)" (Lu, 2000: 26). The most recent popular TV serial called *Woju* (*Live in a Snail Shell*, 2009) takes on three hot and controversial topics in a changing Chinese society: corruption, second wives (*ernai*), and the high price of housing. While the series was originally planned in 35 episodes, the last two episodes were never broadcast and, according to a rumor, authorities banned them because the subject matter was too sensitive. Studying how different audiences interpret the drama's representation of controversial topics could reveal the hopes, tensions, and anxieties of citizens in China's rapidly changing society.

The second potential area of research relates to Chinese audiences' negotiation and construction of their identities along the vectors of gender, sexuality, and class. Numerous TV dramas and newspaper and magazine reports can provide rich background materials for this kind of research. While Rofel (2007) analyzes how men and women of different social classes negotiate their national identity in the process of watching a TV drama, more research needs to address the impact of China's transitions on family relations, gender roles, and norms; on changing ideas of respectability and upward mobility; and on practices of romance and sexuality. Audience research on gender and sexuality in China should be situated within the contexts of an increasing social stratification and of a neoliberal consumer culture that commodifies women and casts them in enduring patriarchal-traditional structures of power, where they are marginalized.

The third promising area of inquiry and research studies how rural residents and older people consume the media. These two groups of people are often ignored despite their large numbers. The majority of Chinese people still live in the countryside. More than 162 million people (11.2% of the entire population) – with the addition of 10 million every year – are now over 60 (Du, 2009). Reportedly China has already entered the ranks of aging societies. For many elderly people, watching TV is one of the most important entertainment activities of their daily lives. Studying

how elderly audiences consume the media not only gives insight into these populations, but also has strong political and social implications for media producers and policymakers.

The fourth promising area of research is the consumption of news programs. News programs and political commentary programs are traditionally viewed as the voices of the party state, but they are also undergoing reform. While poker-faced anchors of *CCTV's Network News* often deliver news in a sober, serious, and solemn way, represented by Luo Jing – a 25-year-old CCTV anchorman who died in 2008 – CCTV has recently hired a fashionable sexy anchorwoman in its program *Zhaowen Tianxia*. Recently Chinese news media programs have also acquired a new importance as part of China's efforts to use media as tools of global soft power. China is reported to have set aside 45 billion Yuan (6 billion US\$) to expand the capacity for outreach of its three major news media outlets: Xinhua, China Central Television (CCTV), and the newspaper *People's Daily*. Thus it is important to study how Chinese news and media programs are consumed by domestic and global audiences. CCTV's annual gala, which is the most watched program since its inception in 1983, is also a very good avenue for future audience research.

With an avalanche of foreign media texts that have descended upon China, especially children's media products, researchers can study how young citizens and their parents are responding to these media and how their exposure shapes, or contributes to shaping, relations across different generations. Each year, China imports large quantities of children's literature and cartoons. For example, in 2007 more than ten thousand children's books were published, and many of them were translations (GAPP, 2008). In 2001 Nickelodeon entered China; 62.9 million Chinese households view its daily half-hour Chinese-language program over 100 cable and terrestrial stations nationwide, and in March 2004 Nickelodeon's "CatDog" and "The Wild Thornberrys" aired on CCTV's new children's channel, for one hour and a half daily, to almost 386 million households across China (www.nick.com). Research on ethnic groups other than the dominant Han community in China would shed light on the challenges of facilitating and sustaining multicultural citizenship in the global economy, a problem that other countries also face. A few scholars (e.g., Oakes, 1998; Gillette, 2000; Schein, 2000) conducted anthropological studies on the culture of Chinese minorities such as the Miao and the Hui, but their research does not center on the media. Media programs produced in Tibetan and Arabic cater for the minority Tibetan and Hui populations. It would be interesting to study the role that specialized linguistic media play in helping minorities preserve their culture yet also forge affiliations with the larger construct of nation.

Last but not least, researchers should consider a paradigm shift when studying audiences. While the above-mentioned research projects and suggestions for research only consider the reception of media texts at the individual level, I argue that researchers should also pay increasing attention to how audiences form various kinds of social networks with each other and how the existing networks affect their interpretation of media products. Given that the new media environment blurs the line between

media producers and consumers, it would be a mistake to view Chinese audiences as contained at the reception end. Rather, researchers should come up with a new model, which looks at how audiences interact with each other, whom they tend to share information with, and how such information flows change the meanings of the media products and provide opportunities for audiences to collaboratively consume, modify, and resist media products. In this sense, online fan culture offers a very promising field of research, not only because huge fan bases have grown that are centered on media celebrities, sports stars, and other public figures, but also because interdependent networks of entrepreneurs, public relations (PR) firms, advertising agencies, and corporations have been developed to market Chinese celebrities as valuable commodities and further to capitalize on fan culture (Li, 2010). While Oates and Polumbaum (2004) study how Yao Ming (the professional basketball player) has been marketed, there is little research on how celebrities like these are “consumed,” even though they are constantly ranked and rated for their popularity. Research on these celebrities should go beyond just media ratings and rankings, if one is to develop a more sophisticated cultural understanding of audiences. Rather, researchers should study the formation of networks among audiences that either identify with the celebrities or partially resist, if not completely reject, celebrity culture. Studying audiences from a network perspective allows us not only to see how social networks structure media production, distribution, and consumption, but also to explore how consumption enables the formation of new social networks.

Conclusion

Commercialization, China’s entry into the WTO, and global influence have shaped the development of the Chinese media industry to a great extent and have guided the trajectories of audience research in China. Generally speaking, audience research conducted by mainland Chinese media scholars has been characterized by an over-emphasis on the positivist tradition; thus audience studies often gets equated with survey research and with the media effects tradition. Researchers in this area tend to stress the utilitarian and applied research that has been funded by media organizations, and this fact has resulted in an inadequate development, at this historical moment in China’s transformation, of theories that are concerned with the complexities of audience engagement with media (Liu, 2008; Hu, 2010).

Some prominent scholars in the field of critical studies have approached imagined audiences or implicit readers through textual analysis, historical analysis, and Marxist criticism, in an attempt to study cultural representations within the larger context of expansion in the media industries, issues of local and global cultural interactions, and China’s embracing of consumer modernity. However, their critical approaches often take an elitist position, without giving due consideration to ordinary audiences’ interpretations of media. Scholars who are trained in the West used ethnographic

approaches to conduct fieldwork and to give voice to audiences; but they have largely focused on cinematic texts and TV dramas, without paying much attention to news programs and other media genres.

In attempting to analyze media narratives as open-ended semiotic texts, some scholars have conducted interesting and informative research, which combines ethnography and in-depth interviews with the analysis of the political economy of media production. Media scholars in Hong Kong have played a leading role in such research. Trained in the West, these scholars have examined topics such as modernity, nation, gender, sexuality, and globalization in the context of a media boom in China. A few Western scholars, largely in the fields of anthropology and Chinese studies, have also published important work on popular culture's influences on the social fabric of different communities.

Some communication scholars have focused their attention on new media such as the Internet and the mobile phone in order to address the topic of Chinese audiences as active users of media technologies. Aiming to understand Chinese users as well as to promote activism, civil society, and community formation, these studies have come side by side with the rapid growth of new communication technologies in China and with the rising importance of this country as a superpower.

Despite the fact that the Internet has recently increased its rate of penetration there, generally speaking the majority of Chinese Internet users are still young, educated, and urban (CNNIC, 2010), which means that rural residents and elderly people are largely excluded. Indeed most audience research in China has generally privileged middle-class and urban populations. Young urban residents with considerable purchasing power represent a valuable consumer audience for transnational and Chinese capitalists and media entrepreneurs. Elderly people and residents in rural areas, who are more likely to consume traditional media such as TV and radio and who cannot contribute much to the current eyeball economy, are often excluded from audience research. Future research projects should pay heed to largely ignored social segments of the population – such as poor women, children, elderly people, and rural residents – in order to correct the urban middle-class bias of most of the existing work on Chinese audiences.

I also suggest that researchers should go beyond the models of traditional audience studies, which focus on the reception of media products at the individual level, and start to embrace social network analysis, which enables researchers to look at how structures affect the reception of media products and how consumption produces new social networks. Given that the new media environment has greatly facilitated communication across various boundaries, studies of audiences from a network perspective have the potential to offer insight into the intertwining relationship between structure and agency.

Media scholarship in China is very new, and Chinese communication, as a field, has been established recently. Media research in China has been largely influenced by communication theories developed in the West, particularly in the US. As the numbers of US scholars who are interested in China increase, the academy should

find ways to support and fund these scholars' interests in empirical audience research in distant locations. The communications academy should do a better job of encouraging students to engage more with comparative modes of thinking about the world; and promoting audience research in developing countries that are witnessing a sweeping economic transition is just a first step toward achieving such an objective. Finally, going beyond essentialist or imperialist models of research on culture and communication, the field of audience studies should nurture not only ethnic Chinese, East Asian, or more privileged Western scholars' interests in China; it should also encourage minorities in Western nations and scholars in non-Western nations to become curious about China and to conduct ethnographic work there.

NOTE

- 1 A note of caution here: Ethnographical research needs careful preparation and contemplation. Douglas Kellner (1995) states that hasty ethnographic research may result in various fetishisms: the "fetishism of struggle," the "fetishism of audience pleasure," and the danger of "celebrat[ing] resistance per se without distinguishing between types and forms of resistance" (pp. 38–39).

Health, Culture, and Power

Understanding Women Audiences of Health Media

Linda Aldoory

ABSTRACT

Only limited research has been published about women as an audience of health messages in the media. Furthermore, most of the well-known health communication theories have not effectively addressed the sociocultural and political environments that construct the medical/health industry and the media, which impact the everyday lives of women and their decision-making in the area of health. This chapter offers a comprehensive overview of the research conducted on women as an audience of mass media health messages. The chapter then critiques this body of knowledge on account of its weak theoretical utility/development for women's health decision-making and empowerment. After review and critique, empirical examples are provided from research and related studies on women's media consumption, in order to reconstruct theoretical arguments that reflect women's everyday lives and contribute to women's decision-making in the area of health. The chapter concludes with an agenda for future research in the areas of health communication and of women as audience.

Issues of health are integral to women's everyday lives, especially as women in Western societies continue to be socially constructed as primary healthcare givers and main consumers of healthcare (Bruhn, 1988; Majority of Women Control Health-Care Decisions, 1997; Thirlaway & Heggs, 2005). Women are more likely than men to seek out medical information and support for health problems (Fallows, 2005;

Fox, 2005; Yanovitzky & Blitz, 2000). Women are in fact the “guardians of health,” for families and for society (Thirlaway & Heggs, 2005, p. 109).

This sociocultural burden of women being assigned the role of health guardian is reflected in mainstream media, niche media, and public health campaigns, which typically include pedagogic media messages designed to create awareness, change attitudes, and induce changes in audiences’ behaviors and lifestyles. In particular, there is a large sector of specialty media that targets women’s health issues, and federal and state funded public health campaigns that target female audiences. As women are more likely than men to rely on media sources when they seek health information (Fallows, 2005; Fox, 2005), the narratives of many media health messages reinforce stereotypical feminine traits, such as the natural inclination to care for others and the prioritization of dieting as a route to achieving beauty.

Research in health communication has subsequently increased its attention toward women as audience members of health media. Most of the scholarship, however, reveals allegiance to a traditional, biomedical paradigm that has long governed Western-based medicine and health science. This paradigm manifests itself in health communication research in a number of ways: through an isolation of cognitive variables; through lack of cultural context; through focus on individuals as agents accountable for their own actions; and through a denial of political, economic, and social hegemonic formations that confound individual decisions about health. However, a growing body of knowledge about female audiences has contributed to a better understanding of the complexities of message appeals and campaign design. Yet, while doing so, this scholarship has largely neglected the broader cultural factors and ideological contexts that constrain how women interpret, negotiate, or resist to representations of the body and of health in public campaigns and in news media.

This chapter will attempt to address the gaps in cultural and ideological critique by offering a synopsis of recent research on women as health audiences and then by stipulating a set of premises that may help to strengthen the scope of future cultural and critical approaches to women as an audience of health media. First I offer definitions of relevant terms in health communication, and then I argue that the biomedical paradigm has reigned as the dominant conceptual approach to research on women, health, and the media. The chapter then outlines and reviews selectively examples of scholarly work that has examined the ways in which health media, news media, and communication campaigns target women. After this review, the chapter offers propositions for developing a theoretical approach that reflects women’s standpoint and that contributes constructively to women’s decision-making on health-related issues.

Definition of Terms

This chapter takes a social constructivist approach to health and health communication. Concepts such as “health” and “audience” can take on different meanings when

considered in this manner and can be interpreted through the lenses of everyday contexts and of intersecting personal and social identities. Therefore, in order for readers to understand my use of terms such as “health,” “health media,” and “audience” in this chapter, I define these taken for granted terms before I proceed to my discussion of health, culture, and power.

First, the word “health” is used in this chapter as the World Health Organization has defined it: “a state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity” (WHO, 2010, p. 1). The “absence of disease” used to be the historical conceptualization of health; it is based on medical science, which isolated the physical body from the mind and spirit. While Western medical practice continues to focus on healing the body, international health organizations and the field of public health helped revise the meaning of health so as to make it include the essential roles of mental, spiritual, and social well-being. According to the WHO’s 2010 *Constitution*, “the ability to live harmoniously in a changing total environment is essential” (p. 1).

Health, human illness, and disease are viewed here as socially constructed states of being. While human illness appears on the surface to be a set of universal conditions – physical and mental symptoms and problems – that all humans experience regardless of their location or culture, illness is simultaneously a private individual experience and a medically defined one, since it is ultimately identified with and felt by an individual (Bagley, 2001). At the same time, cultural norms and political systems also (re)constitute our foundational ideas of and assumptions about health and sickness. The process of aging and the process of giving birth, for example, are two natural human experiences that are medicalized and often defined as diseased. The traditional, biomedical perspective considers health as an organizing system of physiological and measurable signs of absence of disease – and the absence of disease is often defined on the basis of young, able-bodied male physiology. Thus, individualized experiences of aging and “symptoms” that coincide with menses and menopause are signs of a “diseased” physiology (Martin, 1987). Cultural norms create perceptions of blame, victimization, and lack of control for many who experience these types of physical states. In addition to health marginalization according to gender and age, there is also stigma against women of color, against the physically disabled, and against lesbian, transgendered, and bisexual women. Thus health and illness are far from being universal categories; instead they are negotiated within the context of women’s intersecting identities and experiences of oppression and privilege and they are dependent on dominant biomedical definitions of healthy and sick in this country.

Discourses of health filter through professional (provider to consumer/patient), interpersonal (family, friends), social (community), and mediatized channels. This chapter focuses primarily on health media, which I define as media content that is intentionally designed to influence health outcomes in audiences. Health media in this chapter include campaign messages presented through television, posters, brochures, billboards, Internet, radio, and magazines; news coverage in print, broadcast,

and web-based formats; and health messages produced on CD-ROM disks and video, comics, and songs designed for entertainment and education. I exclude messages in popular contexts that potentially have an impact on health attitudes and behaviors but are delivered without the producers' explicitly stated intentions. While such popular media are important to study in order to advance our knowledge of the subtle ways in which audiences register implicit messages concerning their bodies and states of sickness and health, this chapter limits its analysis to manifest, informative, and persuasive messages that are intentionally crafted to educate and to promote and attempt to change health outcomes.

The audiences that are intended for health media are conceived of as fragmented and more fluid than in past conceptions of an audience, which argued for monolithic groups (Byerly & Ross, 2006; Livingstone, 2006). New technologies, such as user-generated web tools, have disintegrated any former notions of a collective mass of people who have similar habits and exhibit universal behaviors. Furthermore, feminist researchers' study of intersectionality has highlighted the inability to assume similar lifestyles only on the basis of one shared cultural identity. Livingstone (2006) suggested, however, that "the audience" should ideally be considered as a "relational or interactional construct" that offers a "shorthand way" of understanding how communication technologies create and facilitate the construction of imagined communities. Such a shorthand construct allows authors such as myself to simplify the real-world conditions of audiences for the purpose of analysis while they remain aware of the constraints and dangers that categories impose.

Research on women and their relation to personal health, medical institutions, and the media has relied largely on simplistic and problematic – linear, binary, and isolated from culture – approaches to the body, to disease, and to audiences' reception of cultural representations. I purposely limit the studies discussed and the interpretations offered to North American perspectives and medical institutions. Within these conceptual and geographic parameters, I will explain how health and healthcare systems, health media, and women consumers of healthcare are all embedded in power relations that inscribe Western health and women. I illustrate these power relations here by describing and critiquing previous research in health communication on women audiences.

Health, Culture, and Power

Health is constituted within contexts of culture and power, and these contexts can sometimes direct audiences to produce meanings that uphold hegemonic constructions of race, gender, and class. Definitions and experiences of health and disease are also based in audiences' membership within given cultural or social orders, and dominant or normative ideologies of gender, nation, class or ethnicity can guide our judgments of health and perceptions of symptoms (Thirlaway & Higgs, 2005).

Arguing for the influence of gendered experiences, Bagley (2001) asserted, "A woman or man may experience an illness in a uniquely gender-specific manner" (p. 442). As Martin's (1987) classic study shows, some women viewed menstruation and menopause as "normal" aspects of womanhood; whereas the medical institutions defined menstruation and menopause as diseased states that required pharmaceutical treatment. Furthermore, Martin also found that women from different racial backgrounds and socioeconomic contexts constructed meanings of reproductive health differently. Cultural differences change how health and medicine are interpreted and then enacted upon in everyday life.

The Biomedical Paradigm

The definition of reproductive processes as medically symptomatic derives from the biomedical perspective that constitutes Western-based medical research and health-care. The biomedical perspective (re)produces relations of power where federal, corporate, and medical authorities control the production of meaning about health in this country. There are several characteristics of the biomedical paradigm that suggest both formal and hegemonic control. First, the biomedical approach to science calls for empiricism, for detachment from what is being studied, and for a hierarchical research relationship between the expert researcher and the examined participant. This sets up a knower/known dichotomy that invests with power medical scientists, physicians, and healthcare organizations and frames the consumers of healthcare as inferior and passive. The normative legitimacy of medical power is illustrated in those situations where women who choose to make personal health decisions without consulting medical practitioners are cast as either naïve or willful, and sometimes as ignorant.

A second characteristic of the biomedical approach is its dismissal of the role of emotionality in health outcomes. Emotions are discredited as a biasing or polluting factor in "accurate" cognitive processing; at best, emotion has been conceptualized as "a heuristic, a mental shortcut, whereby people access their pool of positive and negative feelings towards an issue to guide judgment" (Thirlaway & Heggs, 2005, p. 108). Yet the medical erasure of the emotional context runs counter to the ways in which individuals and families who live with illness experience and grapple with emotions on a routine basis (Sharf & Vanderford, 2003). Mishler (1984) argued that there is ongoing conflict between the "the voice of medicine" and "the voice of the lifeworld" – where the lifeworld is viewed by medical practitioners as insubstantial to healthcare. Emotionality is a stereotype ascribed to women; thus women are rendered inconsequential by the biomedical paradigm.

A third characteristic of the biomedical paradigm is its emphasis on a pharmaceutical treatment of the physical body, which results in the body being medicalized and isolated into examined and potentially treatable parts. The focus is on the individual level of analysis, where, according to the paradigm, visible and measurable change

of the body and of health can be monitored and observed. As a consequence, holistic views of health are ignored or minimized, and non-Western forms of healing are considered placebo agents, or even dangerous impediments to the patient's recovery. By extension, US medical institutions can devalue some communities' non-Western approaches to health and treatment as unscientific or outdated.

Finally, the biomedical paradigm constrains health practices through economic power relations (Sharf & Vanderford, 2003). Sharf and Vanderford explain the economic commodification of healthcare in the following terms: "Consumers purchase it, providers supply it, third-party payers and health care organizations manage it, and primary care practitioners coordinate and guard entry to more specialized modes of treatment" (ibid., p. 13). Both Condit (1994) and Turow (1989) have extended this argument to health communication, to suggest that doctors are considered the best authorities on health information because they do exert some control over what counts as expert knowledge and as critical economic resources. The professional and cultural capital of doctors, as the most elevated authorities on health and disease, gets further enhanced when audiences report that they are the most credible spokespersons in health news and in public health campaigns.

In everyday life there is a confluence of the biomedical and the sociocultural "life-world" frames, and this confluence creates multiple and yet constraining views and practices of health and illness. Individuals experiencing illness negotiate their identities within healthcare's contested political and economic terrain in this nation. Knowledge production on, and interpretations of, treatments for illnesses manifest themselves along hegemonic racial, economic, and gender lines. The biomedical "norm" for being healthy consists, subtly and politically, in being white, thin, male, young, heterosexual, able-bodied, and financially secure. Communities of women and people of color are often marginalized by the medical environment as a result of such assumptions, which in turn shape the formulation of health standards.

I use the phrase *medical environment* here so as to include physician and hospital services, federally funded medical research, professional training and education, and related public health practices and research projects. I am referring to this collection of medically produced entities as an "environment" because racial, economic, and gendered marginalization does not always manifest itself openly in patients' conversations with healthcare practitioners; instead, subtle and sometimes hard to detect norms and values that lie beneath the taken for granted professional norms of medicine create the potential for women to be marginalized. If female health consumers internalize meanings of trivialization and lack of power in health contexts, then ultimately they may think and act in a manner that has a negative impact on their own health.

Health Media

The biomedical paradigm is reflected in health media, and in particular in media used for public health campaigns that attempt to change behavior, which is often the main goal of such campaigns (Sharf & Vanderford, 2003). Most campaigns assume a linear

progression, in their audiences, from knowledge increase to attitude change, with the intent to change concretely a health outcome. Meta-analyses have indicated that behavior change is successful in only approximately 5 to 7% of all public health campaigns (Snyder & Hamilton, 2002; Derzon & Lipsey, 2002). Yet reliance on the biomedical paradigm continues to guide campaign planners toward the ongoing pursuit of behavior change and toward the use of a linear model of communication that removes media messages and media effects from historical and social contexts. Health campaigns need to reassess their organizational and long-term campaign priorities, re-examine their definitions of success, and consider seriously the roles that culture, power, and meaning-making play in shaping the contours of health.

Also, like healthcare, economic structures and power relations have an impact on health media (Sharf & Vanderford, 2003). The media overwhelmingly portray women's health issues from a middle-class perspective because medical and pharmaceutical establishments favor middle- to upper-income consumers, clients, and patients (Condit, 1994). Therefore health images in news, campaigns, and popular media tend to mirror middle-American lifestyles and problems. The channels selected tend to be those that imply access via economic resources: while posters in bus shelters continue to be a tactic for urban segments of campaign populations, Internet and cell phone technologies are the predominant mode regardless of the age or socioeconomic status of the audience targeted.

One example of this derives from my own experiences as a campaign consultant. A team of researchers completed an extensive, in-depth research about audiences of over 65-year-old adults in this country and about their media use and preferences. We found that, while Internet use was increasing among this population, over 80% of the older adults did not use the Internet, and the majority of these people did not wish to use Internet or *did not have access* to computers. The research we conducted revealed that older adults used and preferred newsletters from hospitals, American Association of Retired Persons (AARP) materials sent to their homes, large text for easier reading, and television. The media planning team subsequently hired by the client was given all these research details, and the team still proceeded to create a media campaign of Internet sources for the audience of older adults. Channels included paid advertisements on Facebook and in online newspapers. Regardless of the older adults' lack of access and desire – and we found many of them to be economically limited, too – the media team wished to prove to the client that their funding made a large impact on today's interactive web environment. The economic drive behind the client and the media team's work superseded the cultural and economic criteria that defined the target audience.

Women and Health

Historically, women have been oppressed by the biomedical assumptions guiding Western healthcare. As explained earlier, the medical profession treats women's natural reproductive processes as states of disease fit to be treated. Also, the stereotypes

of emotionality and mental instability have led physicians to prescribe tranquilizing drugs and anti-depressants to more women than men (Nussbaum, Ragan, & Whaley, 2003). Women report experiencing more health problems and seeking out healthcare more frequently than men. However, one study found that, although women asked more questions than men, healthcare providers gave shorter and less technical answers to women's questions (*ibid.*, p. 194). Gabbard-Alley (1995) stated that, "although women spend more time involved in communication acts in health contexts, for whatever reasons, their concerns are taken less seriously than are those of men" (p. 39).

However, as explained earlier, women are typically ascribed the caregiver role within the context of family and of societal norms (Thirlaway & Heggs, 2005). In interviews with mothers about family food choices, De Bourdeaudhuij (1997) found that women felt a responsibility to keep everyone in the family healthy and satisfied with the food provided. This type of "unpaid caregiving" is distinctly gendered. Culturally prescribed gender norms assume that women from all types of racial, ethnic, geographic, and class backgrounds hold ideals of nurturance, compassion, and self-sacrifice (Gahagan, Loppie, Rehman, Maclellan, & Side, 2007). Whether accepted or contested, women often adopt the role of unpaid caregiver, even within expansive kinship networks (Gahagan et al., 2007, p. 48).

Women seek out health information more than men, and they do so through media sources (Warner & Procaccino, 2007). Recent studies have shown that women are more likely to go online to seek health information, and that women who are online are there mostly to look for health and medical information and to get support for health and personal problems (Fallows, 2005; Fox, 2005; Warner & Procaccino, 2007). These studies do not contextualize the consumer-seeking behavior within cultural, economic, or social contexts: perhaps women online have greater access to computers because their class position affords them access to capital, professional employment, and transportation; or perhaps unemployed women have more spare time to think about health-care and to seek out information online. Questions of identity, cultural perspective, and economic constraints are significant factors that influence women's exposure to and reception of health media. Current research, however, has restricted explanations for women's meaning-making to certain isolated cognitive variables. Some research projects such as my own have begun to engage with questions of culture and power in this area, but there are very few other studies that attempt to offer a holistic critique or to engage with women's interpretations deeply enough to account for health media's varied intersections with and impact on society.

Women as an Audience of Health Media

The research on female audiences of health media reflects the dialectical tension between the biomedical paradigm and a sociocultural perspective, where both simul-

taneously facilitate and constrain research designs and interpretative approaches. On the one hand, scholars have increasingly attended to cultural sensitivity, racially and ethnically diverse participant groups, and marginalized and underserved populations of women. Studies have offered greater understanding of how women with different identities and from different cultural communities make meaning of various forms of health media through the lenses of race, class, and everyday experiences of illness and disease. However, current-day studies continue to focus on woman's accountability for behavior change, and few researchers analyze the effects of medicalization on women's bodies and minds. There is limited analysis of the power relations in play that benefit medical and economic interests while constraining women's choices; and the racial and gender hegemony of the medical and media systems are rarely interrogated.

The body of knowledge on women as a health audience is too large to be summarize completely or described in detail in this chapter. What I do here instead is to present some themes that characterize the research published in this country; and I limit the search to the last 15 years. The themes help illuminate the gaps in understanding that will be critiqued in the conclusion of this chapter. For each theme, I include a description of one or two representative studies that have been published since 2000.

Formative Research with Female Audiences

There have been some published articles that report formative research findings, which became the basis for developing health campaigns (Bull, Cohen, Ortiz, & Evans, 2002; Doyle et al., 2006; Lindsey et al., 2007). Focus groups reveal women's opinions and responses that are then mined to design slogans, posters, or other health messages.

In Bull and colleagues' (2002) study, focus groups were used to investigate opinions about female condoms in order to develop a female condom promotion campaign in Denver, Colorado. The authors stated that the participants were "women" aged between 14 and 25. They reported that these participants were of varied racial identity, although race was invisible in the description of findings and interpretations. Researchers first used some of the women's opinions about female condoms to design posters that were subsequently shared with focus groups for feedback. Findings suggested that the participants wanted direct statements about female condoms making sex less worrisome than male condoms do, because female condoms allow women to have more control over their sexuality and reproductive functions. This study represented a rigorous and systematic model for focus group methodology, because researchers held groups with women at three separate time periods during the development of campaign messages: before launching the design, during the campaign, and afterwards, for final revisions. The voices of the women were implemented through visual and textual elements of the final campaign materials. However,

there was no explanation for why young and older adolescents were defined as adult women and included in women's discussions of sexual intercourse, unprotected sex, and condom use. The reader is led to believe that the participants were sexually active; but there was no interrogation of the power relations within the family and in the more private partner contexts that regulate sexuality.

Health Messages as Cues for Individual Cognitions

The largest group of studies on women and health media tests the impact of media-tized messages on individual cognitions (Hether, Huang, Beck, Murphy, & Valente, 2008). Scholars believe that psychological factors can be linked to behavioral intent, increasing the likelihood of behavior change, which is the primary goal of the health messages examined in this research. Dependent measures include knowledge, attitudes, intent to engage in requested behavior, and sometimes actual behavioral outcomes. This cognition-to-behavior link guides the theories that dictate the selection of independent variables for researchers to measure in their assessments of a media campaign's outcomes. The popular theories in health communication are the same ones that prevail in the research on women audiences: social cognitive theory, the health belief model, and the theory of reasoned action/planned behavior (Airhihenbuwa & Obregon, 2000; Freimuth, 1995). This group of studies does not interrogate the influence of institutional factors and gendered norms about women.

For example, Hether and colleagues (2008) analyzed findings from a panel survey (of repeat survey-takers from a research company's email list). The survey had an 8% response rate; the participants were 92% white, 69% married, and 66% had a close family member or a friend with cancer. Thus a somewhat select group of women responded to a questionnaire about their knowledge, attitudes, and behavioral intentions following the viewing of a breast cancer survivor's story. The study's "most important contribution" was the finding that watching two breast cancer stories on television had greater effect on knowledge, attitudes, and behavioral intention than watching only one breast cancer story (Hether et al., 2008, p. 820). Authors did not critique the intersectional identities and cultural experiences that may have led this particular group of women to feel that watching two stories had greater salience for the person than watching just one.

All cognitive theories in health communication attest to the relevance of self-efficacy for behavior change. Self-efficacy is the perceived confidence that one can successfully engage in the behavior requested in the health message. Self-efficacy can be linked to understandings of empowerment and control, and therefore it can be an important construct in the study of women audiences. Some authors argue that self-efficacy is a significant predictor of disease prevention and of detection behaviors among women (Allen, Sorensen, Stoddard, Colditz, & Peterson, 1998; Anderson & McMillion, 1995; Lipkus, Biradavolu, Fenn, Keller, & Rimer, 2001; Prentice-Dunn, Floyd, & Flournoy, 2001; Stein, Fox, Murata, & Morisky, 1992). One study found that

– according to the categories used by the authors – “Hispanic women” were more likely than “white women” to believe that they can do nothing to prevent getting heart disease (Christian, Rosamond, White, & Mosca, 2007). Another study found that perceived social norms can influence self-efficacy; when women perceived greater social acceptance of a behavior, their self-efficacy in performing that behavior increased (Egbert & Parrott, 2001). These general findings were not analyzed in the context of racial and class hegemony, which defines health practices in this country; however, the results do offer an opportunity for questions to be posed about hegemony and the role of culture in mediating perceptions of self-efficacy.

Women and Health News

Research on women as an audience of news about health risk examines interpretations of risk probabilities and the impact of spokespersons as legitimate presenters of safety information. One study examined how 170 women employed by a large corporation interpreted risk probability in a news article (Thirlaway & Heggs, 2005). Findings showed a wide variety of responses in how the women described their own risk after reading the article. A few reinterpreted the health risk in quantifiable phrases and did not articulate an emotive response. Some used words such as “frightening” and “concerning,” others responded with guilt, and still others restated the facts without expressing any obvious opinion or attitude. Only 20% of participants reported intent to change some behavior; and the reasons given for not changing behavior reflected resistance toward the media, toward “expert” opinion, and toward “science” and “statistics” (p. 114). The authors concluded that “experiential contexts” were filters for the women’s responses to the health risk news.

Studies of spokesperson impact have revealed a gendered context for how women make meaning out of risk news. Siegrist, Cvetkovich, and Gutscher (2001) found that women had less trust in news spokespersons who were authorities than men did, and that women gave less support for government officials’ decisions not to investigate a high-risk event. In another study we explored how women created meaning out of news about the safety risk concerning a food supply; and we did this through 23 in-depth individual interviews (Vardeman & Aldoory, 2008b). When news texts were shared with the participants, we found that, initially, the latter expressed concern for loved ones rather than for themselves. Regardless of whether one was a parent or not, a participant articulated meaning within her perceived role of caregiver; as one participant said, “it’s just this like guilty feeling because you’re supposed to be the one providing the nutrients.” Most of the participants expressed distrust of the federal and medical organizations represented in the news; they did not believe that government and medical spokespersons prioritized the needs of female consumers over the governmental goals of reputation or organizational profit. However, in the face of high risk, the participants felt compelled at least to attempt to take the protection measures suggested in the news.

Our study also explored whether experiential and cultural characteristics in spokespersons enhanced the salience of news for individual participants. The majority of participants preferred the spokespersons in risk news to be similar to them not only in terms of physical and demographic characteristics, but also in terms of familial context and risk susceptibility. For example, a female spokesperson shown to be empowered within the formal system of government and within the system of science increased the participants' perception of legitimacy and salience of the messages in relation to the health threat. One participant said: "If it's a woman spokesperson talking about it, and she seems really passionate about the issue [...] then I look at them like, 'Wow! They're in a position of power.'" Additionally, when the spokesperson transmitted a sense of involvement and susceptibility, this heightened the participant's emotional response to news about there being a threat, as well as the salience of this news for her. Perhaps the spokesperson's vulnerability to the health risk lowered her control over the situation, and participants perceived this state as balancing the relations of power between them and that person; this in turn heightened the audience's sense of legitimacy of the message, since it was not coming from a distant or neutral "third-party" representative who would not understand vulnerability to a risk that may impact women.

The participants also shared the constraints they had perceived in processing meaning and in deciding on a course of action after their exposure to the news. The primary barrier was the perception of limited alternatives to the food in question. "Tell us what we can do without stopping feeding our kids yogurt and cheese and milk that they live on everyday. Give us some other practical suggestions [. . .]." Some women had limited media access and did not trust alternative media outlets. Another barrier to action was the prioritization of other health threats in their everyday lives. Finally, race and ethnicity also played a role for the women of color in the study. The participants represented a diverse group – with respect to age, race, and ethnicity. The women of color expressed greater concern about the health risks communicated in the news and a desire to change their food behaviors to reduce the risk; but they also communicated less self-efficacy in their perceived ability to do what was being asked of them in the safety messages of the news.

A second study, of the audiences created by pregnant women, nursing women, and women with young children, explored how these women construct meaning in a contested media environment that targets them as a high-risk audience (Vardeman & Aldoory, 2008a). The study was conducted around the news coverage of methylmercury levels in fish (FDA & EPA, 2004). The new FDA (Food and Drug Administration) and EPA (Environmental Protection Agency) guidelines were issued just three years after a different set of federal guidelines on eating fish; this fact, together with variations in health risks according to type and amount of fish, and together with a simultaneous promotion of benefits from fish consumption, created a situation where the news environment relating to fish consumption represented

conflicting and confusing messages. The setting for our study was this contested news terrain: rather than examine just one news story as a static textual unit, we sought to replicate the natural media environment about fish consumption at the time. News media tended to report the risks without a historical perspective, which added to the contradictions. The media offered a prime environment, designed to explore how women from federally defined high-risk groups made meaning out of risk news and its messages. Actual news articles from local and regional newspapers were introduced to six focus groups conducted across three Mid-Atlantic states – in an eastern shore community, in a suburb, and in an urban city. Eastern shore groups offered a perspective from women who relied economically on the fishing industry.

Most of the women were already aware of the contradictory nature of messages about eating fish safely. To articulate their understandings of the risk messages in the study, participants compared the conflicting information to their current knowledge and past experiences. Many of the pregnant women and of the women with small children expressed confusion about the risk, because they perceived it to be directly related to their caregiving ability and they sensed a loss of control over the role this ability entailed. The confusion was accompanied by feelings of concern, fear, anxiety, and guilt about whether they could eat fish or feed it to their families. Even though the benefits of eating fish continued to be touted in the news, the women's purposeful avoidance of any fish offered them a way to regain control in an ambiguous health context, which they perceived as having a direct impact on their identity as caregivers. For women living in fishing economies, there was skepticism about the media, the government, the fish packing industry, and the environmental groups. These participants did not believe that the warnings were based on fact – they perceived their source as having a low credibility rate, or they did not think that enough facts had been offered in the news to support the idea of there being a real risk. These women survived on sales of fish throughout the region; they told stories of resistance against the regulatory efforts of state agencies. The women negotiated their struggles within contested relations of power with their husbands and economic providers, and with what they perceived to be a controlling government and constraining activist groups. Their oppositional readings of the health message also illustrated their belief that the media were primarily representatives or “voices” of the government.

Again, the participants described certain barriers that prevented them from engaging in safe fish consumption. First there was a lack of available realistic options to eating fish. Related to this was the lack of details in the news about everyday practices that would enable one to decide about fish and amounts of fish. As one woman asked: “How are we to know when we go to the store which fish come from waters that are subject to a mercury advisory?” Next, other health risks took priority in these women's busy everyday lives. And, finally, low self-efficacy led women to believe there was nothing they could do about the problem.

Medically Underserved Women Gain Some Attention

Fortunately, the past few years reveal a trend toward more studies with medically underserved women, who traditionally had been invisible in health communication research. Medically underserved populations have limited access to health facilities, quality healthcare, and health insurance. The phrase “medically underserved” has replaced the phrase “hard to reach” in public health discourse, in attempts to acknowledge the role of institutional and medical constraints that keep at-risk populations from seeking healthcare. While some women consciously resist a mainstream medical environment and are “hard to reach” by health workers and by health messages, women who are medically underserved typically *desire* access to affordable quality healthcare, and they do seek accurate health information in order to make sound health decisions (Wathen, 2006). Women already face gendered norms that trivialize their personal health concerns; in the case of medically underserved women, additional racial, ethnic, or sexual marginalization occurs.

Research on these communities of women has focused on health topics such as breast cancer and Acquired Immune Deficiency Syndrome / Human Immunodeficiency Virus (AIDS/HIV) and has emphasized one broad racial, ethnic, or geographic category – for instance Hispanic women, African American women, rural women – in the analysis of research participants (Anderson & McMillion, 1995; Egbert & Parrott, 2001; Meana, Bunston, George, Wells, & Rosser, 2001; Stein, Fox, & Murata, 1991). While increasing, the number of studies of marginalized women is significantly lower than the number of studies that rely on convenience samples of white middle-class women. Some recent studies do not publish any demographics or identities of the research participants. Due to this ongoing invisibility of identity in the research, I take more time here to furnish greater detail from the few studies that have highlighted the voice of marginalized audiences of women.

There have been a few studies investigating Latino populations and their perceptions of health messages. One such study investigated “Hispanic” (labeled as such by the researchers) women’s preferences for receiving breast health information (Oetzel, DeVargas, Ginossar, & Sanchez, 2007). Hispanic women are at greater risk of breast cancer than of any other cancer, and yet they are significantly less likely than other black and white women to engage in early detection methods such as self-examination or mammography. “Availability of health care and health insurance are the major structural barriers to cancer screening in Hispanic populations” (Oetzel et al., 2007, p. 224). The authors used a convenience survey of 176 women, most of whom identified themselves as Mexican American, and these women indicated English as their preferred language. Almost two thirds of the participants were married, had at least some college education, and held private health insurance (18 participants had Medicare/Medicaid, and 29 reported no health insurance). Findings indicated that the women who valued the element of interdependence with others in their life used a variety of sources of information about breast cancer screening. Women who

identified with both traditional Hispanic culture as well as American cultural values used media channels as well as family sources for breast cancer screening. Those women who did not identify either with a traditional form of Hispanic culture or with American culture responded to fear appeals in health messages and resisted expert spokespersons. While cultural identity was measured via quantitative items that did not provide in-depth meaning to cultural cues, Oetzel and colleagues (2007) did allow for greater variation in the ways in which culture should be considered. Rather than rely on simplistic measures of attitudes, the authors included more nuanced characteristics such as sense of ethnic identity, self-image, perceived assimilation with US culture, and relational connectedness.

More studies have been done with black women as health audiences than with other women of color; and, again, studies in this country have prioritized AIDS/HIV and breast cancer. Frisby (2002), for example, recruited a convenience sample of 92 “African American women” (the label used by the researcher) from a “Northeastern metropolitan area” to complete a questionnaire about breast cancer and mammograms (p. 494). African American women have a lower incidence rate of breast cancer but a higher mortality rate. Frisby argued that “early detection would significantly reduce morbidity and mortality numbers of African American women” (p. 489). The sample of women varied by age, income, and level of education, although the findings were not analyzed according to these intersectional identities. The author summarized the findings into five conclusions: (1) the women held negative thoughts of death and fear relating to breast cancer; (2) they typically thought of campaigns and products such as the pink ribbon; (3) they did not have knowledge of the causes or risks of breast cancer; (4) they desired “rational” advertising appeals, which communicate causes and risks; and (5) the women wished to see “role models” of African American women who survived breast cancer and subsequently led productive lives (p. 500). Frisby’s conclusions support the findings reported in studies of white women and in studies of female participants whose identities remained invisible in the published articles. With breast cancer information women tend to react negatively the first time round, and they desire someone who looks like them to be represented in the messages. To extend the findings on women and breast cancer, a discussion is needed about black women’s higher mortality rate in the context of a medical hegemony that privileges white women, and also in the context of cultural and intersectional identities that may help explain why women do not find that campaign messages are salient for them – or why they even fail to expect salience at all.

Kreuter and Haughton (2006) conducted a quasi-experimental study to assess the usefulness of *cultural* tailoring on African American women and their cancer prevention knowledge and practices. The authors selected four cultural constructs they believed to be salient for African American women: religiosity, collectivism, racial pride, and time orientation. For the women in the treatment groups, cancer-related knowledge and prevention behaviors increased when messages were tailored so as to speak not only to the women’s cultural cues, but also to their sense of self-efficacy, motivation, and other cognitive characteristics. Graphics and text for the tailored

magazines were developed with the extensive participation from African Americans (the authors did not specify if these participants were female).

There have been a few studies that focus on Asian American women as audiences of breast cancer prevention campaigns (Jenkins et al., 1999; Sun, Zhang, Tsoh, Wong-Kim, & Chow, 2007). Asian American women have a higher mortality rate than African American and white women, although the prevalence rate of breast cancer is lower among them. Asian American women have the second lowest breast cancer screening rate among all ethnic groups in the United States (Sun et al., 2007). In their study, Sun and colleagues found that Chinese-language public service announcements on radio increased breast cancer knowledge and related health practices. In this convenience sample of Asian women, results also indicated that respondents with an education above high school and women from Hong Kong showed a superior ability to recall breast health guidelines from media messages. Again, while this research was important by giving a voice to an invisible sector of marginalized women, the findings do not really illuminate the “lifeworld” experiences of participants. These experiences may help scholars distinguish specific factors such as higher education and spokesperson demographics, which may affect the ways in which different groups of women perceive health messages.

Offering a Context for Women and Health Media

There have been very few reception studies of women as consumers of health media that have included critiques of the social and cultural norms that have an impact on how women accept, negotiate, or resist health messages in the media (Grodin, 1991; Press & Cole, 1995; Simonds, 1992). Over the last 10 years, however, scholars have made some tentative progress in this area of research. In earlier projects I did attempt to take a cultural approach in order to explore the ways in which women made meaning out of health media. One study examined a media environment rather than a media text as a unit of analysis (Aldoory, 2001). Additionally, I did not impose any one health topic for discussion with the 50 women who participated in focus groups and individual interviews; I let the women formulate their primary health concerns, and I allowed them to take the lead in discussing and debating these concerns. The groups were set by similar race, class, sexual orientation, age, educational level, and professional status (*ibid.*). For example, one focus group comprised women who identified as African American and as Caribbean American, employed, married, and in their forties. Another focus group consisted of women in their forties who identified themselves as lesbian and labeled themselves “working class” and white. I made an effort to pay greater attention to the impact of intersectional identities on women’s engagement with health and medical issues.

The primary health concerns varied a great deal; they included heart disease, diabetes, menopause, eating disorders, breast cancer, and Medicaid. While some of these concerns, like menopause and hormone replacement therapy, were directly

connected to being female, others related to conditions that have been socialized as feminine, such as eating disorders. Race, ethnicity, class, and sexuality played an integral role in how the participants decoded health messages, and pregnancy and motherhood also influenced participants' attitudes toward their bodies. The women's personal experience of health problems and their beliefs about the medical establishment were relevant to their interpretations of health messages. Finally, source credibility and beliefs about mainstream media were used to decode health messages. For participants who reflected the type of woman targeted by mainstream health messages, there was a great deal of personal relevance and comprehension of health messages. This greater acceptance of mediated health messages in everyday life by the women of US dominant/mainstream race and class would ultimately enable increased attention to and improved opportunities for health. Participants from cultural groups that are underserved by medical institutions and by media did not attend to mainstream health messages in the same way. Thus many of the women in the study did not see themselves reflected in health media messages – not even after they acknowledged the attempts at cultural competence made by health organizations and media campaigns. For the lesbian women in the study, no attempts have been made to address their health needs; in fact these women documented hostility from gynecologists and other health practitioners who prioritized reproductive health and issues of fertility.

For these women, message reception was a process by which primary health concerns were negotiated and integrated into everyday life over time – each media message discussed by participants was not perceived distinctly, but rather was considered in the context of greater meaning related to a given health concern. Participants cognitively connected and compared health messages, accepting some meanings and rejecting others, within the contexts of their self-ascribed identity, cultural norms, motherhood and pregnancy, opinions about the source and media in general, and experiences with health, illness, and medical environments. As other scholars asserted, the participants negotiated the meaning of a health concern at a broad level rather than at the level of some particular message (van Zoonen, 1994; Wathen, 2006).

An Agenda for Research on Women as an Audience of Health Media

This chapter reflected on some recent research that examined women as an audience of health messages and illustrated some themes found in the work conducted in the United States. Overall, there has been a lot of research on female audiences of health media, but very little of it has placed culture and gender at the center of analysis. While many of the studies offer contributions to understanding women in this capacity of an audience, others reveal gaps that leave invisible the cultural factors, gender

norms, and power relations governed by medicine, government, and media institutions, all of which affect the way women create meaning out of health messages. Furthermore, while intersectionality has become important in critical studies and in feminist media research, it is virtually absent in the study of women as an audience of health news and health campaigns.

I outline below certain theoretical premises and new directions that can take into account and help explain the different responses of women to health media and shed light on the various factors that influence the meanings that women ascribe to representations. These premises should be considered intellectual moments designed to pose new questions and to propel future research that can support, extend, or elaborate upon the current state of knowledge on female audiences of health media. I hope that the agenda I propose below will lead to further development of research and to a burgeoning of theory-building in the area of gender, media, culture, and health communication.

Negotiated Meaning of Health

Through the lenses of power, culture, identity, and hegemony, women construct negotiated and often troubling meanings for health, illness, and disease. I like to believe that, ultimately, mediatized health messages can make an impact on women's health, and certainly most of the research in this area directs attention toward women's health outcomes – for instance increasing regularly scheduled mammography, performing breast self-exams, and using condoms consistently and correctly. However, given the negotiated contexts, I argue that there can be several other “outcomes” that represent worthy pursuits and are in need of studying. Goal-directed health media could attempt to increase the following: the salience of a health issue at personal level; the ability to use health-related information; confidence in making decisions about health; and an awareness of power structures and constraints that hinder good health. Future research on female audiences needs to explore these outcomes of meaning rather than outcomes of behavior, so that media messages might be better directed at women's everyday lives.

Negotiated Media Environment

As van Zoonen (1994) has suggested, women go beyond an individual health text and broaden their negotiated meanings to the larger context of a health issue, which includes understandings of media and of the healthcare industry. What is actively negotiated over time is not the meaning given to one text, but rather the meaning of a given phenomenon, such as breast cancer, and its role in a woman's life. There is limited research in this broader area of audience reception, but such studies might offer contributions to understanding how women interpret health and their identity as a healthy person. Health messages are seldom interpreted in a vacuum; the overall

media environment, culture, community, and society all create meaning for women, even at the moment when a woman interprets a single health message within this larger context. Therefore examining the broader media context is important to understanding how women interpret particular health messages in the media.

Intersectionality as an Analytical Lens

Women's intersecting personal identities shape meanings that health messages have for them (Glenn, 1999; Valdivia, 1995; Zinn & Dill, 1996). There has been a dearth of studies in health communication focusing on the interconnected experiences of women as gendered and raced subjects. Intersectionality assumes that women's identities are always expressed and defined by the interwoven and inseparable categories of race, gender, class, and sexuality. A commitment to understanding intersectionality creates research that is more complex, more realistic, and more sensitive to cultural contexts, all of which are significant for studying women as audiences of health media. Additionally, an intersectional approach complicates matters related to oppression and resistance, as these relate to audiences of, and to potential actors in, health. According to Weber (2001), a woman can "occupy both dominant and subordinate positions and experience advantage and disadvantage" because of race, class, gender, and/or sexuality (p. 105).

Constraints as Lived Reality

Women filter interpretations of health media through prisms of perceived constraints that create their lived realities and limit the success of health media focused on behavior change. Yanovitzky and Blitz (2000), through secondary analysis of national data, found that, while both interpersonal and mediated communication were important in motivating women to seek mammograms, mass media were particularly important for women who did not have regular access to a physician, while the physician's advice was more important for those women who did (p. 129). Women may perceive constraints that are invisible to health care practitioners, or that are trivialized by the medical establishment in this country. Exploring the differing sets of constraints that women have would not only increase the potential for greater access to health information, but might also empower some women in their health decision-making and in their relationship with the healthcare system (Brown, Carroll, Boon, & Marmoreo, 2002; Wathen, 2006).

Caregiver Role

The sociocultural role of caregiver, ascribed to women in this country, creates for women a perspective through which they can view health messages. The caregiving

perspective is not exclusive to mothers and pregnant women. While mothers and pregnant women may have a heightened hegemonic sense of caring for their children, the caregiving role impacts women who care for older parents, who make doctors' appointments for partners and husbands, and who care for siblings and friends, often in healing ways. In the research I conducted about risk news, young women expressed concern about their parents and boyfriends. "Unpaid caregiving" is a social burden that some women accept and endure as a form of additional stress, which lowers their own health status, while other women ignore or even resist the caregiving role – and then they have to face family, organizational, and societal criticism and disdain for their rejection of nurturing behaviors. Health media reflect this cultural stigma through images of women caring for others and being the ones responsible for visits made to healthcare practitioners. Health media research should explore how women see themselves in this role and how the burdens of caregiving influence their interpretations of health messages and of decision-making about health.

Deep Cultural Meanings Help Improve Salience

Health campaigns that use only outward appearances of racial, ethnic, and language sensitivity will likely draw attention from the target audiences of women, but they will not necessarily result in personally meaningful considerations made by the women. Kreuter and Haughton (2006) examined the usefulness of Hall's (1984) "levels of culture" and Resnicow, Baranowski, Ahluwalia, and Braithwaite's (1999) "deep structure of culture," and they found that an integration of surface-level and entrenched or deep cultural meanings creates greater personal relevance for women. One scholarly move toward including deeper structures of culture in health messages has entailed involving indigenous cultural members as co-designers and partners in the development of health messages. Research has shown that this, along with participatory action research, produces greater behavioral motivation as an effect of health campaign messages (Kreuter & Haughton, 2006).

Conclusion

While research on women as health audiences has increased, the scholarship continues to reinforce the assumptions of the biomedical paradigm: for instance the isolation of cognitive variables from their contexts and the disavowal of the power relations that structure the individuals' reception of representations in health media – and hence their involvement in, and their decision-making about, vital healthcare issues. The growing body of knowledge about female audiences has increased sensitivity about marginalized groups of women, and it has also contributed to a better

understanding of message appeals and campaign design. Yet it still neglects broader cultural factors and ideological contexts that constrain how women consume and interpret narratives of health in media texts.

The research agenda proposed in this chapter emerges out of a critical review of existing work on women's interpretations of health messages and on the various contextual factors and structural constraints that impinge upon audiences' abilities to make sense of the numerous explicit and implicit messages concerning health that they receive from different media technologies, media genres, and media sources. Future research can thus begin to address more vigorously the topic of health media in relation to gender and culture, and to build what will hopefully be a robust cultural theory. Such a theory should germinate out of empirical work that centers on the voices of the women who make health decisions that have an impact on their everyday lives and on the lives of their families and societies.

Boom or Boomerang

A Critical Review of Evidence Documenting Media Literacy Efficacy

Smita C. Banerjee and Robert Kubey

ABSTRACT

This chapter advances research on media literacy by reviewing studies that utilize media literacy in either short-term or long-term interventions. Media literacy interventions on a wide array of topics including violence, smoking, alcohol, and advertising are reviewed. Effectiveness of media literacy is discussed using various criteria: duration of intervention, intervention design, target group, intervention modality, causal process, and different strategies for media literacy interventions. Key questions addressed in this chapter ask how media literacy efficacy is defined, and what issues surround media literacy efficacy.

Media Literacy Defined

Media literacy has been most commonly defined as the skills of accessing, analyzing, evaluating, and communicating messages in a number of forms (Aufderheide & Firestone, 1993; Hobbs, 1998). Davies (1996) has emphasized listening, viewing, or reading audiovisual texts as basic skills that need to be learned by young audiences. The need for learning technical skills to decode the meanings behind the media, and developing a critical understanding of the relationship between different message content, forms the backbone of media literacy education. Kubey (2004) notes that

The International Encyclopedia of Media Studies: Media Effects/Media Psychology, First Edition.

Edited by Angharad N. Valdivia, Erica Scharrer.

media literacy involves critical analysis of media messages, evaluation of sources of information for bias and credibility, increased awareness about how media messages influence people's beliefs, attitudes, and behaviors, and production of messages using different forms of media. Similarly, the website of the National Association for Media Literacy Education (NAMLE) (2010a, 2010b) describes the functions of media literacy in this way.

Within North America, media literacy is seen to consist of a series of communication competencies, including the ability to access, analyze, evaluate, and communicate information in a variety of forms, including print and non-print messages. Media literacy empowers people to be both critical thinkers and creative producers of an increasingly wide range of messages using image, language, and sound. It is the skillful application of literacy skills to media and technology messages.

Despite considerable disagreement among scholars regarding how to conceptualize and perform media literacy (Kubey, 1998), most scholars agree on a common set of key concepts. The Center for Media Literacy (2007) has endorsed the following five core concepts as central to media literacy: (1) all media messages are social constructions (i.e., constructed by somebody and never able to reflect reality entirely); (2) people who make media messages use creative languages that have rules (i.e., creative components such as words, music, movement, camera angle, and others are utilized to develop a media message in different formats such as a magazine cover, advertisement, etc.); (3) different people experience the same media messages differently; (4) producers of media messages have their own values and points of view; and (5) media messages are constructed to achieve a purpose, usually for profit and/or power.

The common goals of most media literacy curricula focus on helping young people become informed and active participants in the communication process, rather than passive message recipients (Brown, 1998). Much empirical research to date has rested on the idea of creating media literacy interventions for protecting young people from negative influences of media (e.g., Austin, Pinkleton, & Funabiki, 2007; Banerjee & Greene, 2006, 2007; Pinkleton, Austin, Cohen et al., 2007). Research suggests that interventions help individuals build resistance to specific persuasive message strategies as they become aware of marketers' strategies, critically weighing evidence and argumentative strategies for learning, constructing one's own arguments, and enhancing learning such as from public affairs programming (e.g., Austin, Pinkleton, Hust et al., 2005; Hindin, Contento, & Gussow, 2004; Wade, Davidson, & O'Dea, 2003).

What is a Media Literacy Intervention?

The term "media literacy intervention" can be understood as an experimental treatment that introduces specific concepts to study participants (any age group) with the

aim of increasing awareness and promoting deeper understanding of the meaning contained in media messages. The general goal of interventions is to provide people with the initial tools of media literacy, eventually leading them to build upon the cognitive skills required to process media messages in a more active manner (Potter, 2004). Research based on using media literacy interventions is generally directed toward altering those human cognitions involved in the processing of media messages that may serve as a defense against the potential negative effects of media (Byrne, 2005).

Several media literacy interventions designed to specifically address prejudice (Ramasubramanian & Oliver, 2007), sexual objectification in advertising (Reichert, LaTour, Lambiase et al., 2007), media violence (Scharrer, 2006), tobacco use (e.g., Austin et al., 2005; Banerjee & Greene, 2006, 2007; Gonzales, Glik, Davoudi et al., 2004; Pinkleton et al., 2007), adolescent alcohol use (e.g., Austin & Johnson, 1997; Chen, 2009), and body image (e.g., Wade et al., 2003; Watson & Vaughn, 2006) have been tested. The question, then, is what the media literacy interventions are trying to accomplish and how. In the section that follows, we summarize recent research that has used media literacy interventions.

Applications and Interventions

Media literacy appears to be a promising framework that can help to increase the critical skills of media consumers and aid in creating more informed and deliberate users. The primary aim of media literacy programs is to increase students' awareness of the forms of media messages they encounter in their everyday lives. They should be able to comprehend, analyze, evaluate, and make reasoned choices about advertising jingles, public service videos, news reports, and so forth (Quesada, Miller, & Armstrong, 2000). As scholars and practitioners have become aware of its usefulness, media literacy is receiving growing attention as an applied intervention strategy. In this section, applications of media literacy across different contexts are examined, with particular emphasis on smoking prevention, adolescent drinking prevention, violence prevention, body image, and advertising awareness.

Smoking Prevention

Media literacy workshops on cigarette smoking have shown favorable results (i.e., reduction in smoking-related attitudes, intention, and behavior) for both elementary and middle school children (e.g., Austin et al., 2005; Banerjee & Greene, 2006, 2007; Bergsma & Ingram, 2001; Gonzales et al., 2004; Pinkleton et al., 2007). Unger, Cruz, Schuster et al. (2001) have suggested that media literacy programs should be developed to inoculate adolescents against tobacco marketing strategies. In spite of a

nationwide call to integrate media literacy approaches with school-based tobacco prevention programs (*Media Literacy Drug Prevention Teacher Survey Report*, 2002), published examples of research are limited (Beltramini & Bridge, 2001).

Recent research suggests that adolescents' increased knowledge and understanding of advertisers' persuasive strategies should lead to increased resistance to advertised messages (Austin, Miller, Silva et al., 2002). Accordingly, research results indicate that in-school interventions can help young people understand the role of tobacco advertising in encouraging tobacco use among adolescents and identify marketing strategies tobacco companies use in their advertisements (e.g., Banerjee & Greene, 2006, 2007; Beltramini & Bridge, 2001). This knowledge base may further transfer to development of or change in attitudes that are conducive for smoking prevention efforts (see Banerjee & Greene, 2006, 2007). For instance, Bergsma and Ingram (2001) tested the efficacy of a media literacy curriculum in changing knowledge, awareness, and attitudes regarding tobacco use in the movies. Pretests and posttests were conducted for children (seventh grade) in experimental and control groups. The results showed that children in the experimental group had an increased knowledge of tobacco product placement in films, awareness of the portrayal of tobacco use in films, and showed negative attitudes toward the use of tobacco in films (Bergsma & Ingram, 2001).

In another study by Pinkleton, Austin, Cohen et al. (2003), a media literacy curriculum was designed to prevent tobacco use among young people. In a span of six lessons, children were taught about the tools and techniques the tobacco industry uses to target young people and learned to create their own counteradvertising. The results showed that the media literacy intervention increased the understanding of the potential persuasive effects of advertising and intentions to take action against tobacco use. The results suggested that media literacy may have the ability to serve as both a prevention tool targeting initiation among nonsmokers and an intervention tool for targeting cessation among smokers.

Adolescent Drinking Prevention

"Media literacy training – which generally teaches young people how to understand and create mediated messages – is a potentially important component of substance abuse prevention campaigns directed to younger audiences" (Pinkleton et al., 2003, p. 2). In a study by Austin and Johnson (1997), general and alcohol-specific media literacy lessons were developed to test their effectiveness on children's (third grade) beliefs about alcohol. Pretests, posttests, and delayed posttests were conducted to test curriculum effectiveness. The results showed that children's expectancies (perceived expectation of the meaning alcohol drinking conveys) and behaviors (children's choice of an alcohol or nonalcohol theme product) were becoming more positive toward alcohol over time, and that the media literacy intervention prevented the increase in positive expectancies. The alcohol-specific media literacy curriculum was

most effective in increasing the understanding of persuasive intent, reducing identification with characters, desirability of alcohol advertising, and similarity with characters in the alcohol advertisements (Austin & Johnson, 1997).

Chen (2009) designed and evaluated a media literacy curriculum focusing on alcohol use prevention. A pretest–posttest quasi-experiment with 171 adolescents was conducted to examine the impact of a negative approach and a balanced approach (a combination of negative and positive evaluative approaches) to media literacy on modifying adolescents' responses to alcohol messages. Results showed that different media literacy approaches had varying degrees of effectiveness by gender. After receiving a negative media literacy lesson, adolescent boys regarded television characters as less realistic and believed that drinking alcohol had negative consequences. Adolescent girls, on the other hand, benefited from a balanced evaluative approach as their media skepticism (a cognitive state of incredulity that encourages more thoughtful processing and additional information seeking; Austin et al., 2002) was enhanced. Chen (2009) concludes by suggesting that health educators should employ media literacy to enhance adolescents' critical thinking skills and to improve their decision-making regarding alcohol.

Violence Prevention

Research studies on the topic of media literacy instruction with children regarding media violence have produced promising results. Media literacy has been shown to increase children's critical attitudes toward media violence, disagreeing that it is harmless, disapproving of characters using violence, and perceiving media portrayals of violence as unrealistic (e.g., Huesman, Eron, Klein et al., 1983; Nathanson 2004; Robinson, Wilde, Navracruz et al., 2001; Rosenkoetter, Rosenkoetter, Ozretich et al., 2004; Singer, Zuckerman, & Singer, 1980).

In one of the earlier studies, Singer et al. (1980) developed eight media literacy lesson plans to help children understand the different types of television programs, technology behind television production, differences between real and pretend on television, and the purpose and types of commercials. The children (from kindergarten through second grade) were divided into experimental and control groups. Pretests, posttests, and follow-up tests were taken to examine the effectiveness of the curriculum. Overall, the results showed an increase in knowledge about how television works as well as an increase in children's capability to question and discuss the violence shown on television. Thus, improvements were seen in the area of understanding of concepts and processes of television, and in initiating the development of critical television viewers (Singer et al., 1980). Huesman and Eron (1986) were also able to demonstrate that media literacy intervention can reduce aggressive behavior among children.

More recently, Scharer (2006) utilized five one-hour visits to sixth-grade classrooms to inform students about media violence and make them critical of the same.

The media literacy curriculum consisted of presentations and discussions around key themes and ethical issues related to media violence, such as rewarded violence, lack of consequences for violence, animated violence, justified violence, and violence perpetrated by likable characters. Statistical comparisons between pretest and post-test responses and between those participating and those in a control group show some increases in the comprehension of key concepts used in the study of media violence and critical thinking about the topic. For instance, learning about lack of consequences in depictions of violence led the participants in the treatment group to express a more critical attitude about the responsibility of media creators (i.e., that they should portray such consequences more). Additionally, qualitative results revealed that post-media literacy program responses were more critical, more precise, and more tuned in to ethical issues than pre-media literacy program responses. Scharrer (2006) concludes: "We can be fairly confident that the media literacy program was, indeed, effective in stimulating participants' critical thinking about media violence" (p. 81).

Body Image

Use of media literacy to address body image is expected to empower students to adopt a critical evaluation of media content so that they can identify, analyze, and ultimately challenge the thin ideal presented in the mass media (Levine, Piran, & Stoddard, 1999). Watson and Vaughn (2006) note that there have been many efforts to design intervention programs that prevent the development of eating disorders and associated risk factors, such as body dissatisfaction. Media literacy interventions have been designed to alleviate the negative effect that the media have on body satisfaction, but the results have been mixed in terms of effectiveness (Stice & Shaw, 2004; see also Chapter 15, this volume).

Research so far has not shown support for the use of media literacy on eating behavior or attitudes (e.g., Irving & Berel, 2001; Levine, Smolak, & Schermer, 1996), and mixed support for weight concern (e.g., Levine et al., 1996; Wade et al., 2003). Watson and Vaughn (2006) examined whether or not the length of a media literacy intervention had an impact on awareness of sociocultural ideals, internalization of sociocultural ideals, and body dissatisfaction. The results suggested that neither short-term nor long-term media literacy interventions increased awareness of sociocultural ideals of attractiveness. However, both short- and long-term media literacy interventions that challenged the perceived realism of the media had the potential to reduce internalization of sociocultural ideals. Overall, the long-term intervention was more effective at decreasing body dissatisfaction than the short-term media literacy intervention.

Wade et al. (2003) used a controlled study to evaluate the effectiveness of a self-esteem program and a media literacy program in reducing general and specific risk factors for eating disorders, namely self-esteem, weight and shape concern, dietary

restraint, and body dissatisfaction. Results showed that only weight concern was significantly impacted by the intervention. Specifically, the media literacy intervention was moderately successful in decreasing weight concern among participants over time as compared with the control group, thereby suggesting implications for future research and greater efficacy. Wade et al. (2003) conclude by stating that “delivery of a media literacy program within an interactive, student centered, self-esteem building framework may potentially be a safe and effective way of reducing risk factors for eating disorders” (p. 381), but clearly this needs greater research attention. Given that internalization of attractiveness norms, body dissatisfaction, and disordered eating ensue not only from media but also from peers, family, and society at large, it is not surprising that media literacy efforts focusing only on media messages have not achieved desirable results (Irving & Berel, 2001; Stice & Shaw, 2004; Thompson, Heinberg, Altabe et al., 1999). Perhaps combining traditional media literacy interventions with self-esteem interventions or other cognitive approaches will provide a more efficacious way of addressing body image concerns.

Advertising Awareness

Among media literacy's aims is to help students recognize attempts at manipulation. Research on media literacy and advertising has shown that elementary and middle school children can be taught to identify and understand the persuasive intent behind advertising (e.g., Collins, 1999; Hoffman, 1999; Ward, Wackman, & Wartella, 1977). Hoffman (1999) developed media literacy workshops for middle school children to teach them the process of advertising and other forms of media. The results showed that children's ability to identify media values (values or concepts media people use in making decisions on what to report as news), media processes, and advertising and propaganda techniques increased significantly from the pretest to the posttest levels (Hoffman, 1999).

In another initial study by Ward et al. (1977), children as young as kindergarten-aged were able to learn how to filter advertising messages so that the persuasive effects of advertisements were mitigated. Ward et al. (1977) suggested that the filter for advertising messages could be used in four different ways. First, it can be used to help children recognize that commercials are trying to sell products. Second, it can be used to help children become skeptical of advertising claims. Third, the filter might reduce the frequency of children's asking for products that they have seen in advertisements. Fourth, it can be used to direct children toward performance and functional attributes of products. The implications of the study point toward the need for a focused and simple media literacy endeavor to make children advertisement savvy.

Despite numerous implications for media literacy efficacy, Kunkel, Wilcox, Cantor et al. (2004) noted that there exists no study that has examined the statistical relation between children's understanding of advertising's persuasive intent and the impact

of advertising and that “there is little evidence that media literacy interventions can effectively counteract the impact of advertising on children of any age, much less the younger ones who are most vulnerable to its influence” (p. 21). In fact, Chernin (2008) showed that a media literacy intervention aimed at showing the persuasive techniques used in junk food marketing made children more likely to choose junk food in an experimental situation, irrespective of age. She hypothesized that children were primed by the intervention or they learned to pay more attention to ads (which increased and not decreased their persuasive power). Therefore, there seems to be more unanswered questions about the link between increase in knowledge or recognition of propaganda in advertising and the impact of advertising; as Chernin (2008) concludes: “Future research should explicitly test the moderating role of knowledge of persuasive intent in the persuasion process and examine how children’s affective responses to commercials influence their preferences for advertised products” (p. 115).

Media Literacy Efficacy: Key Issues

Duration of Intervention

Various media literacy interventions have been evaluated, and the duration of these interventions has ranged from single-session (Ramasubramanian & Oliver, 2007; Reichert et al., 2007), to dual-session (Banerjee & Greene, 2006, 2007), to 3–6 sessions (e.g., Austin et al., 2005; Pinkleton et al., 2007; Scharrer, 2006), to 8–10 sessions (e.g., Gonzales et al., 2004) and longer (e.g., Duran, Yousman, Walsh et al., 2008).

An unresolved issue within the realm of media literacy research concerns optimal dosage and the length of expected effects on target audiences’ attitudes and behaviors. The five or six sessions (or even more) incorporated in some media literacy curricula engage students in analyzing, critiquing, and sometimes producing media messages (e.g., Bergsma & Ingram, 2001; Gonzales et al., 2004; Pinkleton et al., 2007; Scharrer, 2006). These kinds of programs have been shown to produce significant knowledge gains among participants but mostly modest short-term effects on attitudes and behavior. It can be argued, then, that the results show an additive effect of receiving the same antismoking message over a span of five or six days that results in a temporary shift in attitudes. Importantly, similar effects were observed for significantly shorter (one- or two-session) interventions (e.g., Austin & Johnson, 1997; Banerjee & Greene, 2006, 2007; Byrne, 2005; Nathanson & Cantor, 2000; Ridolfi & Vander Wal, 2008), suggesting that brief media literacy interventions work equally well as longer ones. For purposes of theory building and explanation, it is important to know what features of an intervention program produce necessary changes. Because the interventions incur cost (time and money), it is important to understand what kinds of strategies/programs work and do not work.

Intervention Design

Media literacy interventions are most often designed as experimental designs with a pretest and posttest (e.g., Austin & Johnson, 1997; Bergsma & Ingram, 2001; Hoffman, 1999), with a treatment and control group (e.g., Austin et al., 2007; Ramasubramanian & Oliver, 2007; Reichert et al., 2007), or a combination of the treatment and control group design with pretest and posttest measures (e.g., Austin et al., 2005; Banerjee & Greene, 2006, 2007; Chen, 2009; Gonzales et al., 2004; Pinkleton et al., 2007; Scharrer, 2006; Singer et al., 1980).

The combination designs present a more intensive yet efficacious model for interventions. The use of control groups enables researchers to distinguish program-related cognitive and attitudinal changes from effects that might result instead from other ongoing statewide, national, or community prevention programs taking place simultaneously. The pretest–posttest designs allow for evaluation and change over time. Additionally, the inclusion of both pretest–posttest and posttest-only conditions makes it possible to identify and exclude possible testing effects (Pinkleton et al., 2007).

One limitation of media literacy interventions is the lack of random assignment, a must in most experimental research. Due to the practical limitations of conducting research in schools, researchers often randomly assign classes to experimental conditions rather than randomly assigning participants, thereby taking a more quasi-experimental stance. Random assignment is necessary for precluding group-based differences contributing to (or causing) any change that occurs. However, statistical controls must be put in place prior to analyses and differences examined on key variables at baseline.

Target Group

Most interventionist media literacy work has been done with elementary and middle school children (e.g., Austin & Johnson, 1997; Austin et al., 2005; Banerjee & Greene, 2006; Bergsma & Ingram, 2001; Chen, 2009; Hoffman, 1999; Huesman et al., 1983; Pinkleton et al., 2007; Scharrer, 2006; Singer et al., 1980), and some with high school students (e.g., Gonzales et al., 2004). According to Anderson (1983), media content like violence, materialism, body image, risk-taking behaviors, and stereotyping of race, class, sexual identity, and gender seems to offer relevant topics for media literacy curriculum development. Underlying persuasive intent, perceived negative effects of such media messages and “value” laden pedagogy may be easily delivered to a young audience (Anderson, 1983). The research in this area is scarce and needs a much more in-depth examination of curriculum effectiveness. There are many organizations that develop media literacy curricula (e.g., National Telemedia Council, Center for Media Literacy, Media Education Foundation, Center for Media Education), but studies on efficacy and outcomes are not abundant (Heins & Cho, 2002).

In recent years, media literacy interventions have been developed and tested on a more mature subset of the population, namely undergraduate students (e.g., Ramasubramanian & Oliver, 2007; Reichert et al., 2007). Media literacy interventions are rarely adequately tailored to the cognitive capabilities and developmental stage of the target audience. For example, they seem to overlook the importance of one's experience with persuasive messages (and substances) as a factor intervening in cognitive responses to media literacy programs. Though children have limited cognitive capacities and largely lack experience as persuaders and have difficulty recognizing and critically evaluating persuasive efforts, adolescents possess more advanced cognitive skills and are experienced persuaders (O'Keefe, 2002). Hence, typical media literacy interventions that emphasize both passive learning and active skill acquisition better fit the cognitive abilities and needs of younger children. Research findings are consistent with this rationale, demonstrating favorable effects of these programs on elementary and middle school-aged children (e.g., Austin & Johnson, 1997; Austin et al., 2005; Bergsma & Ingram, 2001).

However, research also demonstrates that the effects of educational interventions on children and young adolescents decay over time as they age and are exposed to other sources of influence such as peers (Bauman & Ennett, 1996; Prinstein, 2001). This is likely related to the tendency of older adolescents to grow skeptical of passive educational efforts that lack sophistication matching their cognitive capabilities and experience with persuasion (Jacobsohn, 2007). One result is that traditional media literacy approaches are not as successful with this subpopulation as they are with younger subpopulations (e.g., Ramasubramanian & Oliver, 2007; Wilksch, Durbridge, & Wade, 2008). Media literacy interventions targeting older adolescents need to establish similar success rates to gain appropriate recognition from scholars and practitioners.

Intervention Modality

Media literacy interventions have been designed and presented using different modalities, such as videotaped instruction (Ramasubramanian & Oliver, 2007; Reichert et al., 2007) or workshops with participants (e.g., Austin et al., 2005; Banerjee & Greene, 2006, 2007; Chen, 2009; Gonzales et al., 2004; Pinkleton et al., 2007; Scharrer, 2006). Different interventions use different combinations of lessons and exercises, such as critical analysis of clips, producing one's own message, and assigning homework done without the direct supervision of the teacher. Future research on media literacy should also examine effective practices that must be embraced by media education teachers (however, no research to date has compared intervention across modalities).

Today, children learn as much (or maybe less) from traditional media as they learn from new media such as the Internet. Hobbs and Frost (2003) note the challenges posed by new electronic media forms as opposed to traditional print or mass elec-

tronic forms such as television. The effects and efficacy of media literacy interventions need to be considered in the context of new and evolving media forms and media convergence (Livingstone, 2004; Rothenberg, 2002) and the combination of strategies such as advertising, information, and entertainment within the same media message (Grigorovici & Constantin, 2004; Shrum, 2004). For instance, a media literacy intervention could look at the most widely used information source on the Internet, Wikipedia (and possibly other informational sites), to identify and analyze the accuracy of information, intellectual property, the perspective of the producer addressing issues such as who is presenting what to whom, and why (Jenkins, Purushotma, Weigel et al., 2009).

Causal Process

Much research on media literacy is atheoretical and there is a lack of clarity about the causal process (or processes) through which media literacy interventions influence attitudes and behaviors of their target audience (e.g., Gonzales et al., 2004; Ramasubramanian & Oliver, 2007; Reichert et al., 2007). Whereas there have been some efforts by scholars to explain the cognitive involvement and subsequent change in beliefs and attitudes (e.g., Banerjee & Greene, 2006, 2007; Scharrer, 2006), much work still needs to explicate those mechanisms underlying the effects.

Media literacy programs employ a variety of strategies but previous evaluations of media literacy intervention programs assessed changes in attitudes and/or behaviors without providing explanations of why and how the participants change attitude and/or behavior when exposed to these programs. Such interventions limit the outcome measures to knowledge or behavior. It is important to explain why and how change occurs to fully understand the role of the intervention (Derzon & Lipsey, 2002). What kind of cognitive processes do the program participants engage in that causes them to change their attitudes, norms, and subsequent behavior? Relatedly, in many instances, attitude change does not lead to behavior change (see Hornik, 2002). To understand how an intervention produces long-term change in attitude, which further results in changed behavior, it is important to understand the learning process. This process-oriented aspect of intervention efficacy is undocumented to this point.

The only consistent effort made in this direction is by Austin and colleagues in their development and use of the message interpretation process (MIP) model (Austin & Knaus, 2000; Austin & Meili, 1994; Austin, Pinkleton, & Fujioka, 2000). The MIP is a decision-making theory and specifically targets individuals' interpretations of mediated messages. According to the MIP model, individuals' decision-making is composed of both logic- and affect-based decision-making processes, including perceived realism, desirability, similarity, identification, and expectancies, all of which lead to individuals' behavioral intention and enactment of actual behavior (Austin et al., 2000). Media literacy research utilizing MIP has shown that media

literacy interventions can affect the decision-making process of adolescents, further leading to changes in attitudes and/or behaviors (e.g., Austin et al., 2005; Chen, 2009; Pinkleton et al., 2007). More research is needed that is strongly grounded in social-cognitive and behavior change theories to allow for a causal explanation of how media literacy interventions work.

Different Strategies for Media Literacy Interventions

According to Davies (1996), the backbone of media literacy education involves learning technical skills to decode the meaning behind the media and developing a critical understanding of the relationship between different message content. In terms of strategies for media literacy education, two different kinds of media literacy workshops have been designed and evaluated by researchers, one focusing on analysis and the other on production of media messages – the two key components of media literacy curricula (Aufderheide & Firestone, 1993).

Analysis

Masterman (2001) stresses the significance of making the textual investigation of any medium more systematic and rigorous by understanding the key concepts, which include: genre (specific kinds of media content, e.g., drama, comedy, situation comedy, talk shows, news, advertising, cartoons), narrative structure (traditional devices used to tell a story, including setting, character development, conflict, conflict resolution, and conclusion), sources (creator and disseminator of information, could be a person via a blog, organization through a website, or television channel), and encoding/decoding (messages are created, or “encoded,” by media producers with a preferred meaning in mind, and then consumed, or “decoded,” by a receiver or audience). This approach to media education allows students to analyze media messages by describing “what’s going on” in detail. Because the students are involved in a critical examination of media messages, this strategy is called the “analysis” module of media literacy. The analysis module can be used for messages that are both pro- and anti-risk behaviors but research to date has not separated and evaluated these two kinds of messages.

Production

Another kind of media literacy program focuses on understanding and applying the production process of television (or any other media form), including lighting, camera angles, sound, time and motion (Fisher-Keller, 2000; Mudore, 2000; Singer et al., 1980; Zettl, 1998). This kind of information provides children with an understanding of how media messages are constructed and how interactions among various production techniques produce specific effects. The production approach of media literacy, however, encompasses some amount of analysis too. According to Kubey (2000), providing opportunities for children to create their own media stories,

documentaries, or news can help students understand the entire process of media production. In addition, students learn best by doing and getting hands-on experience. Tyner (1992) cautions production-centered media educators because the excitement of creating their own media can often lead to a lack of critical understanding of the media message by students. Nevertheless, the production approach to media literacy is often credited for increasing student self-esteem by engaging them and providing opportunities for self-expression (Tyner, 1992). Because the students are themselves involved in creating media messages, this strategy is called the “production” module of media literacy.

Examining Analysis vs. Production Strategies

The two strategies of media literacy training, analysis and production, are utilized in the creation of media literacy curricula (see Austin & Johnson, 1997; Bergsma & Ingram, 2001; Pinkleton et al., 2003). However, for practical and economic purposes, it becomes necessary to evaluate the difference in efficacy of the two strategies. A review of the available literature suggests that no research to date (with the exception of Banerjee & Greene, 2006, 2007) has tested message analysis versus message production strategies for changing attitude, intention, and behavior. Banerjee and Greene’s (2006, 2007) research provided greater support in favor of the production approach in bringing about desired changes in intention to smoke and attitude toward smoking. In terms of cognitive processes, there was an overall support for production workshops eliciting more attention and more positive workshop perceptions than analysis workshops.

Most of the media literacy interventions are focused almost exclusively on having participants acquire the knowledge/skills needed to resist influence from persuasive media messages but generally fail to form students’ motivation to resist such influences. In many interventions (Hafstad & Aaro, 1997; Ramasubramanian & Oliver, 2007; Siegel & Biener, 2002; Sly, Hopkins, Trapido et al., 2001; Worden & Flynn, 2002), students either passively (when they are “told” rather than a two-way discussion) receive persuasive messages/advertisements or engage through discussion activities. Ample research demonstrates that actively engaging audiences in prevention interventions is a more effective strategy than passive reception (Botvin & Griffin, 2007; Tobler, Roona, Ochshorn et al., 2000).

Understanding Media Habits and Media Literacy

Another approach to media literacy can involve having young people examine and come to better understand their media habits. One area that can be pursued is for young people, as well as adults, to learn the ways that various media, television in particular and also videogames, get us to view or play longer than we intended. Television frequently teases the next program and tries to hold viewers longer. Videogames are highly habit forming because players want to achieve higher scores or advance through levels and opponents. Videogames also inculcate the experience of “flow” wherein a person concentrates deeply, enjoys the experience, and keeps

playing for long periods of time as long as the challenges of the activity are well in line with the person's skill level (Kubey & Csikszentmihalyi, 1990).

Flow often comes about when the challenges of an activity closely match the skill of the person. As importantly, rapid feedback is critical to a person experiencing flow. In videogame play, the game keeps getting harder and stays well matched with the player's skill level, which is also increasing, and the feedback is nearly instantaneous. Further, players today are often playing with others in the same room or online and form teams, and a player cannot readily be pulled from the game without letting his or her teammates down. By learning how television, videogames, and the Internet hold our attention, either by their nature or intentionally by the creators, people can become more aware of how they get pulled in and why it is often so hard to pull oneself away.

Following on the work of Kubey and Csikszentmihalyi (1990, 2002) that demonstrated that television viewing could be habit forming, Brock (2006) ran an experiment with children and was able to show that having young people go without television for a month was, indeed, possible. Indeed, some children volunteered to go even further and do without television for three months. The key, which surprised the researchers, was that so many children succeeded and it was clearly the result of the enterprise being a group effort. One child by herself might not have lasted long, but a whole class of fellow students made the difference. It became a social, team enterprise.

Young people can be helped to become more aware of their media habits by keeping a personal diary of media use to see how many hours each day or week are spent on television, videogames, the Internet, and so on. The idea is not to demonize these media but to heighten student awareness of how reflexive media use can be.

A Final Word on Efficacy

Some media literacy interventions do seem to help participants to become better "critical thinkers" about media content, processes, and effects (e.g., Austin et al., 2005; Gonzales et al., 2004; Pinkleton et al., 2007; Reichert et al., 2007; Scharrer, 2006). Media literacy instruction also appears to trigger some thought about media content and its comparison to "the real world" (e.g., Rosenkoetter et al., 2004; Scharrer, 2006). Gonzales et al. (2004) conclude: "Media literacy within the conceptual context of social influence emphasizes the importance of environmental metacontingencies that can influence behavior change and offers an important rationale for understanding mechanisms that could contribute to sustained behavior change" (p. 197).

However, some media literacy interventions have shown mixed or inconclusive results. For instance, Wilksch et al. (2008) examined the efficacy of a media literacy intervention targeting perfectionism and media literacy compared to control classes in reducing eating disorder risk with adolescent females aged around 15 years. Perfectionism was defined by personal standards (the extent to which an individual

sets and tries to achieve high standards for himself/herself; Shafran, Lee, Payne et al., 2006) and concern over mistakes (the extent to which an individual has excessive concern about making mistakes and consequences for self-worth and others' opinions; Bulik, Tozzi, Anderson et al., 2003). In eight sessions each, the perfectionism intervention addressed issues related to eating disorders such as what is perfectionism, assessment of self-perfectionism, what and who influences perfectionism, and changing behavior. Media literacy intervention, on the other hand, addressed issues such as stereotyping, media advertising, pressures from media, and consumer activism. The perfectionism intervention was overall more successful than the media literacy intervention or control group on some outcomes. Media literacy intervention, however, recorded no statistical improvements across the assessment points, and results for the media literacy program were comparable to those of the control condition. Wilksch et al. (2008) conclude by stating that "further investigation is required to determine the demographic most likely to benefit from media literacy" (p. 939).

In another study, Robinson et al. (2001) tested their media literacy curriculum designed with the goal of reducing children's exposure to media violence on third and fourth graders. The 18 lessons included topics such as budgeting time spent with media, participating in a "turnoff" exercise, and selectively choosing media. Children who participated in the curriculum experienced a significant drop in aggressive playground incidents but there were no significant changes in their perceptions of the world as mean and dangerous. A media literacy study was designed by Dorr, Grave, and Phelps (1980) to develop and test media literacy curricula based on "industry" (production of entertainment programs and industry's economic system), "process" (processes and sources for evaluating television content), and "social reasoning" (role-taking skills). The overall results showed that children learned the curricula and used the curricula to discuss television's reality. However, children's attitudes did not change as a result of learning the curricula.

Ramasubramanian and Oliver (2007) caution against sporadic use of media literacy and conclude that "media literacy training might have a boomerang effect by activating prejudice instead of decreasing such feelings" (p. 641). In their study, Ramasubramanian and Oliver (2007) explored the role of media literacy training and counterstereotypical media exemplars in decreasing prejudicial responses toward Asian Indians, African Americans, and Caucasian Americans. Participants were exposed to a media literacy video or a control group video, followed by an activity to analyze stereotypical or counterstereotypical news stories. The media literacy video introduced participants to the harmful effects of media and the tendency of media consumers to make generalizations based on biased media exemplars. The video also focused on strategies for becoming critical and reflective consumers of media messages. In contrast, the control video focused on various journalistic writing styles such as hard news, feature writing, and so on. Contrary to the researchers' expectations, results revealed that the media literacy video seemed to increase prejudicial responses as compared to the control video. One of the reasons for such a

finding could be attributed to the fact that the media literacy training utilized in this study was primarily a didactic one-way exercise and did not involve any discussions or interactions between participants, which cautions us against the use of media literacy as a purely “preachy” or “didactic” strategy.

In fact, Byrne (2009) suggests that using media literacy activities in the classroom without involving a cognitive activity may actually backfire. In a study on reducing aggression from exposure to violence in the media, Byrne (2009) demonstrated that fourth and fifth grade students who were exposed to a purely didactic media literacy lesson without involving a cognitive activity reported greater likelihood of using aggression as compared to participants who were exposed to the didactic media literacy lesson combined with a cognitive activity after the lesson. One of the reasons for this finding may be that the media literacy didactic lesson increased participant attention to violence in the media but did not give students any cognitive skills to resist the effects of violence (Byrne, 2009). Therefore, it can be concluded that media literacy interventions need to take on a more participatory role wherein both teachers and students are engaged in tasks involving critical thinking skills. Giving greater empowerment or “voice” to the younger audience while teaching them certain analytic skills may improve efficacy of media literacy interventions.

Conclusion

Research on media literacy remains in its infancy in the United States. It is, after all, a relatively new field. We believe we can expect better studies in the years ahead that will shed more light on what sorts of media literacy education interventions are most effective. The future is bright for media literacy education and research, but increased funding is also needed, especially on basic research problems. Although interspersing media literacy research with social or health-related issues makes it difficult to design the research so that it focuses exclusively on media literacy, designing media literacy interventions to address a relevant social or health issue allows for better funding opportunities to examine media literacy efficacy with a greater focus on appropriate outcomes. Media literacy intervention research is a ripe area for future research endeavors to help develop not just efficacious interventions but to examine the causal processes that make such interventions efficacious.

Perceptions of Media and Media Effects

The Third-Person Effect, Trust in Media, and Hostile Media Perceptions

Yariv Tsfati and Jonathan Cohen

ABSTRACT

Research about the way people perceive news media has made progress in three parallel avenues. The first used the concept of credibility and trust; the second used the concept of hostile media perceptions; and the third – focusing on perceptions of media impact – used the concept of the third-person perception. In this chapter, we argue that these three avenues are empirically and conceptually connected and that they are related to media effects in three ways. First, people's mistrust of media has been found to moderate the influence of media on the audience in an array of studies. Second, people's perceptions regarding media impact matter, albeit indirectly, because people react to these perceptions as if they were real. Third, the effects of perceptions of media influence are amplified when they are coupled with perceptions of media hostility, especially among audiences that are personally and emotionally involved in the issues on which media texts report.

People are exposed to information about the world by the news media. While this information shapes one's opinions about the world, attitudes toward the media themselves are also developed in the course of news consumption. Opinions about media may be generalized (e.g., the media are liberal; Lee, 2005), or targeted to the way specific topics are covered by news media (e.g., media are against genetically modified

foods; Gunther & Liebhart, 2007). Three important types of attitudes toward media have been identified by previous research; they relate to trust in media (Kohring & Matthes, 2007), perceptions as to whether media favor or are hostile toward specific topics or groups (Vallone, Ross, & Lepper, 1985), and beliefs about how powerful media are and how they affect the self, other individuals, and society (Davison, 1983).

Though social psychologists researching attitude formation and change may be interested in attitudes toward media simply as a way to study attitudes, media scholars have found them to be interesting for other reasons. Attitudes toward media have been shown to be important because they affect a host of social and political behaviors and thus they have received a fair amount of attention in recent years. In this chapter we review recent work on trust in media, which has been at record lows in recent years (Gallup, 2010). We then review work on the hostile media phenomenon and on the influence of perceived media influence, and end by examining how these disparate literatures are connected in order to suggest new theoretical insights.

Audience Trust in Media

The notion of audience trust in media applies the concept of trust, originating from interpersonal interactions, to audience interactions with media. In a general sense, “Trust is a psychological state comprising the intention to accept vulnerability based upon positive expectations of the intentions or behavior of another” (Rousseau, Sitkin, Burt, & Camerer, 1998, p. 395). In trust relations, there are two sides: the trustor, the side that places trust, and the trustee, the side being trusted. The trustor and the trustee interact in *an uncertain situation* in which the trustor stands to gain or lose. Trust is a *voluntary expectation* on the side of the trustor that the interaction with the trustee will lead to gains rather than to losses (Coleman, 1990). However, trust is not only about predictability and uncertainty reduction (Tschannen-Moran & Hoy, 2000, p. 577). We can reliably predict that someone else will be dishonest or self-serving and thus distrust him or her. Since the trustor cannot be certain about the intentions of the trustee, for trust to take place the trustee must be considered at least somewhat believable or credible. This is why some definitions of trust stress the credibility (Rotter, 1967) and honesty (Fukuyama, 1995) of the trustee. Oftentimes, when one is dependent on others, believing in the other’s good intentions is not enough and some trust in the other’s ability to perform may be required for trust. Thus, several definitions of trust invoke the notion of competence.

Can We *Trust* the Media?

Does the concept of trust, as defined above, apply to the interactions of audiences with media? As we have seen, trust implies uncertainty on the side of the trustor. In

the context of the news media, given that the media deal with the impersonal world (Mutz, 1998), audiences are always at least somewhat uncertain about news media content, in the sense that it is usually hard for them to verify media reports with non-media sources (even for those who still believe in the possibility of objectively valid information despite postmodern conceptions of reality as socially constructed). Not only is it hard for us to verify the validity of the *information* that appears in the media, it is even harder to verify the *character* and *intentions* of those working in the media. Hence, it is often hard to evaluate the fairness of media *interpretations* of reality (Kohring & Matthes, 2007).

As mentioned, trust implies potential gains and losses for the trustors. Admittedly, in mass media audience contexts, the risks on the side of the audience may not necessarily be as grave as in other scenarios. People might be wasting their time watching the news only to find out that the information they received is wrong. Moreover, they might be misled by inaccurate or unfair news portrayals that have potential attitudinal or behavioral consequences. Such consequences may include supporting the “wrong” candidate or policy based on media information that later turned out to be wrong or even deceptive, or not having an H1N1 vaccine based on an inaccurate media report on safety problems.

Why Do People Trust or Mistrust Media?

General Social Survey data show that the rate of US citizens having hardly any trust in the press grew from a low of 14.6% in 1973 to a high of 41% in 2006. As media scholar James Carey (1995, p. 393) put it, “above all, the press lost credibility and respect; it was no longer believed. As poll after poll showed, journalists have earned the distrust of the public.” Some put the blame for the decline in audience trust on politicians, who increasingly slam the media (Domke, Watts, Shah, & Fan, 1999). Others argued that audience mistrust is the product of mounting coverage of the media by the media that results in heightened audience awareness of journalistic blunders and scandals (Watts, Domke, Shah, & Fan, 1999). According to other explanations (Cappella & Jamieson, 1997), people are cynical about the media because the media themselves are cynical. In line with this explanation, journalists’ “strategic framing” of politics leads to political cynicism which in turn feeds back on journalists (see also D’Angelo & Lombard, 2008).

Regardless of the decrease in audience trust in media in the United States in recent decades, additional research has tried to decipher what makes people trust or mistrust the news media. Two types of answers emerged. The first ties audience trust in media to some feature of the text. For example, journalists’ sourcing practices – for example, quoting or not quoting a source in the story’s headline – was found to be related to the perceived trustworthiness of the news story (Sundar, 1998). Newhagen and Nass (1989) found that audience trust in a news story is related to their perception of the individual person presenting the news story. Factors such as race and

gender of the newscaster were related to audience trust (with males perceived as more trustworthy than females, and race affecting perceived trust only for male newscasters; Balon, Philport, & Beadle, 1978). Medium characteristics such as television's ability to provide sound and pictures as evidence supporting the claims of the news stories, and the possibility to use hyperlinks to external sources in online news, explained why television news was perceived as more credible compared to print journalism in the 1960s, and online news was perceived as more newsworthy than television news early in the twenty-first century (Kiouisis, 2001).

The second type of answer is related not to the text but to audience characteristics. Not much is known about the personality of media trustors versus mistrustors but we do know that trust in media is related to interpersonal trust (though weakly; Tsfat, 2002) and to other forms of political trust (Jones, 2004). Conservatives are more mistrusting of the news media and liberals more trusting (Jones, 2004), and those with extreme attitudes are more mistrusting than moderates (Gunther, 1988). Involvement with the issues covered by media also reduced trust in news coverage (Gunther & Lasorsa, 1986). For instance, Palestinians and Israelis are more likely to mistrust coverage of the Middle East than US citizens who have had no direct ties with, or experience in, the Middle East. These findings point out that much of people's trust or mistrust in media is explained by their own biases (Gunther, 1992). This topic relates to the next section of this review, namely, the hostile media perception.

What are the Consequences of Audience Trust in Media?

In general, trust is known to be more likely to lead to cooperation whereas mistrust is likely to decrease cooperation (Blackburn, 1998; McAllister, 1995). How do we apply this logic to media contexts?

One type of evidence about consequences of trust in media demonstrates that audience trust in mainstream news media is associated with mainstream news exposure and that mistrust of mainstream news is associated with exposure to non-mainstream media (Tsfati & Cappella, 2003). The associations are rather small, however ($r = .18$ at best), indicating that many people report that they read and watch news they do not trust. A possible explanation is that news may satisfy diverse needs including some that are not related to the core of trust relations. People may watch news they do not trust because it helps them stay in touch with other people, because it is interesting, or because it is fun. Since reported levels of trust in media are relatively low, it is obvious that some people will watch news they say they do not trust while trying to filter out information they consider biased or untrustworthy.

Another line of research on the consequences of trust in media explored whether audiences trusting the news media are more affected by news media coverage than those mistrusting. Indeed, the evidence points out that, at least when it comes to certain news media effects, audience trust in news media is related to news media effectiveness. This is true with regard to agenda setting (Tsfati, 2003a; Chapter 1, this

volume), priming (Miller & Krosnick, 2000; Chapter 3, this volume), and climate of opinion perceptions (Tsfati, 2003b). For example, when the public opinion climate portrayed in media predicted that George W. Bush would overcome Al Gore in the 2000 US presidential elections, media-trusting audiences were more likely than non-trusting to perceive that Bush was the likely winner, but when the mediated opinion climate changed and the news media predicted a Gore victory, trusting audiences were more likely to perceive that Gore was the likely winner. However, some media effects (especially cultivation effects of news) seem resilient to audience mistrust of media and take place even in the absence of trust (Tsfati, 2002). Moreover, research on the role of media trust in media effects has not been thus far investigated in the context of behavioral effects.

The democratic implications of audience mistrust of media remain unclear. Given the essential role news media play in democratic processes, the drop in audience trust in news media in the last decades in the United States has been presented by some scholars as a problem for democracy (Jones, 2004; Kohut & Toth, 1998). On the other hand, other scholars have argued that audience mistrust in media could be seen as healthy skepticism (Gaziano, 1988, p. 278).

While there is no clear-cut answer to the question of whether audience mistrust in media is good or bad for democracy (and a similar argument is made regarding political trust; see Cappella & Jamieson, 1997), there is quite a bit of evidence indirectly bearing on this question. For example, research has documented that *mistrust* of media is correlated with higher political participation (Tsfati, 2002; Chapter 22, this volume; but Ho et al., forthcoming, demonstrate that perceptions of media bias are related only to issue-specific political participation and not to participation in general), and higher political involvement (Eveland & Shah, 2003). Hence, we do know that citizens' mistrust of media probably does not produce political apathy. On the downside, we know that mistrusting audiences do not tend to discuss politics more often, and when they do discuss politics, they do so with ideologically like-minded individuals (Eveland & Shah, 2003). According to some accounts, the increase in audience mistrust of the news media over the past 40 years has been an important contributor to the growing polarization of the US political system (Ladd, 2005).

In sum, audience trust in the news media has roots both in the journalistic text and in the characteristics and biases of the audience. Trust is related to audience news diets and to the way people respond to news. But trust is a general attitude, targeted toward news media as an institution. How do people perceive specific news texts? This topic was covered by research on hostile media perceptions.

Hostile Media Perceptions

As part of their drive to be consistent and avoid dissonance, people's perceptions of other people and social groups that they favor tend to be favorably biased (Hastorf

& Cantril, 1954). To test this notion in the context of news, Vallone et al. (1985) screened several news segments about the Sabra and Shatila massacre in Lebanon to pro-Arab, pro-Israel, and neutral students on the Stanford campus. As expected, each group saw the coverage as, on the whole, less sympathetic to their side, more sympathetic to the opposing side, and generally hostile to their point of view. This pattern of findings, repeated since many times, has been dubbed the hostile media phenomenon (HMP), suggesting a general perception about news media as being hostile to one's own positions and social affiliations. Perloff (1989) showed not only that partisans (again pro-Israelis and pro-Palestinians) believed coverage to be biased against them, but that each group of partisans also believed that neutral audiences would be persuaded by this hostile coverage to support the opposing position. In a second experiment, Perloff (1989) showed that neutral observers did not in fact change their attitudes following exposure to the materials and thus there was no basis for the partisans' biased suspicions.

More recent research has clarified several aspects of the HMP. First, Gunther and Schmitt (2004) demonstrated that this hostility bias may not necessarily take place when it comes to non-media messages. That is, people reading the same text presented as a student essay instead of news did not perceive it as hostile. To explore why news media tend to be singled out to be perceived as hostile, Gunther and Liebhart (2006) conducted an experiment that varied both the source of the message (news vs. student essay) and the reach of the message (will or will not be published), and found that both the identity of the source and the expected audience independently contribute to the perceived hostility of the text.

But there are limits to this bias. What happens when partisans see media coverage that is clearly supportive of their view? In such cases, when coverage is clearly slanted in favor of one's own position, research has found that partisans do not see media coverage as hostile but they do see it as less positive or supportive of their position than non-partisans or opponents. This is known as the relative HMP (Gunther & Chia, 2001) to denote that while clearly favorable coverage is not seen as objectively hostile, the bias does not completely disappear but rather just becomes relative.

Why Do Partisans Believe the Media are Hostile?

Because the HMP occurs when reading media messages but not other messages, it seems that when partisan audiences are exposed to news coverage that affects a topic they are involved in, they process it in a defensive manner. This sort of processing makes the coverage seem more negative. Three specific mechanisms have been suggested (Gunther & Liebhart, 2007) and were tested by these authors in a critical experiment involving materials regarding genetically modified foods presented to partisans as either press coverage (the mass media condition) or a student essay (non-media condition).

The first mechanism tested as explaining the HMP suggests that partisans tend to selectively recall more negative than positive information. This explanation was tested and found incorrect (Gunther & Liebhart, 2007). Partisans from the two camps remembered a similar number of arguments from both sides. A second explanation focuses on the extent to which supporting and opposing arguments are treated as valid. This explanation had been experimentally supported in previous research (Giner-Sorolla & Chaiken, 1994). This explanation, known as the different standards mechanism, suggests that because opposing arguments seem less legitimate, their presentation in news reports is seen as proof of biased reporting. In testing this explanation, Gunther and Liebhart (2007) found that different standards were used to decide what was legitimate to include in both the media and non-media conditions, and therefore the different standards mechanism cannot serve as a good explanation for the HMP, which occurs differently when exposed to media and non-media messages.

Finally, a third explanation that has received mixed support suggests that information is differentially categorized as supporting and opposing each position in a way that makes the coverage seem more negative. In essence, strong supporters of a position tend to see mildly favorable or neutral arguments as hostile to their position, simply because they are not supportive enough. For example, from the vantage point of a union leader, arguments that support a strike but perhaps endorse some compromise may seem hostile, whereas from a neutral point of view they may seem to be supportive of labor's position and against management.

Who is a Partisan?

In studies of the HMP, a consistent finding is that media coverage is perceived as hostile by partisans but not by neutral audiences. But what is it that makes someone a partisan and thus susceptible to hostile media perceptions?

In the persuasion literature, involvement is a central concept that explains many facets of attitude maintenance and change (Petty & Cacioppo, 1984) and has been explained in various ways (Choi, Yang, & Chang, 2009). In general, individuals are involved with those topics that matter to them and that they care about. Though involvement is often related to attitude extremity with involved people having more extreme attitudes, this is not necessarily the case and extremity and involvement are conceptually distinct. Attitude involvement is associated with more effortful processing of attitude-relevant information (Petty & Cacioppo, 1984) and being less likely to change one's attitude.

There are various reasons one may be involved with a topic. Someone may be involved with a topic because it has personal relevance to their lives (e.g., an event about to occur in one's town). A subset of issues that are personally relevant are those which are outcome relevant such as a tuition hike that is slated to occur in one's own university as opposed to another university. A third type of involvement

relates to topics that perhaps have no personal or outcome relevance but relate to one's values and thus are important and are associated with strong feelings (e.g., a religious person holding an anti-abortion belief). A final type of involvement is ego involvement whereby one feels so strongly about a topic and identifies with a group defined by that attitude (e.g., party affiliation, nationality, ethnic group) to such an extent that one's self-concept would be threatened if this attitude changed.

Perloff (1989) suggested that his research as well as the initial studies by Vallone et al. (1985) indicate that ego involvement drives the HMP, but these researchers did not directly test groups of partisans defined by other types of involvement. As mentioned earlier, Gunther and Liebhart (2007) report studies that rule out personal and outcome relevance as bases for the HMP. They explain that if an issue has practical relevance, a person is likely to value accurate information over consistent information, but if the involvement is expressive rather than instrumental, then consistency is likely to trump accuracy. For instance, even an individual who has a basic mistrust of media may attend and react to information about a new tax code change that affects her but feels that the very next news story about foreign policy is hostile to her ideological position. Providing additional support for the importance of ego and value involvement, Choi et al. (2009) find that ego/value and outcome-relevant involvement are distinct and that the former has a greater impact on the HMP.

What are the Consequences of the HMP?

The HMP has the potential to polarize public opinion because those who care the most about any issue become convinced that the media are against them. Thankfully, the same partisans who believe the media are out to get them do not rely on this perception when estimating public opinion. Rather, both the United Parcel Service workers and the Teamsters who had opposing attitudes about a Teamsters strike (Christen, Kannaovakun, & Gunther, 2002) projected their own attitudes on others and thought that the US public supported their view more than their opponents' view despite negative media coverage.

Tsfati and Cohen (2005a) found that among Gaza settlers who were threatened with an evacuation of their homes there was a high degree of hostile media perceptions, and that the more settlers felt the media were hostile toward them, the more they mistrusted Israeli democracy and the more willing they were to use force to oppose the government evacuation. Tsfati (2007) found that members of the Arab-Palestinian minority in Israel who felt that mainstream Israeli media are hostile to Palestinian Israelis tended to feel alienated from Israeli society. Interestingly, the perception of negative coverage was also associated in both studies with a belief that the settlers and Israeli Palestinians suffered from a negative public image (Tsfati, 2007; Tsfati & Cohen, 2005b), suggesting that unlike the striking Teamsters, settlers projected their perceptions of media coverage, rather than their own self-view, onto others. Thus, the HMP can have severe consequences for democracy but only under

some conditions. In other conditions (perhaps when a group does not feel as marginalized or is as insular as the minorities studied in Israel were), it is limited to attitudes about the media.

The perception that media are hostile becomes crucial especially if one believes that the media are powerful. Individuals may think that if media have little influence over what others think, it may be unpleasant that they disagree, but if they are powerful agents of influence over others, then their oppositional messages represent a more serious social problem. Thus, the importance of the HMP is linked to perception of media influence, which is the third focus of this chapter.

Perceived Media Influence

The degree of influence and power people attribute to media and their content is another topic of interest for media scholars. One thing that has been clearly established is that such attributions are inaccurate. Several key findings point to the conclusion that the way we view the media has as much to do with how we view ourselves (or would like to view ourselves) and others than with an assessment of the media or media content. Davison (1983) identified the original bias that is referred to as the third-person perception (TPP), namely that people attribute greater power to the media when they are asked about its effect on others than when they are asked about media influence on themselves. This basic finding has been replicated endless times in an array of areas from health communication (Gunther, Bolt, Borzekowski, Liebhart, & Dillard, 2006), through parental mediation of violent televised content (Tsfati, Ribak, & Cohen, 2005), to audience reaction to media panics (Tewksbury, Moy, & Weis, 2004). Indeed, replicating this bias has become so popular that one survey ranked the third-person effect fifth on a list of “most popular theories” in contemporary communication research (Bryant & Miron, 2004). A meta-analysis (Sun, Pan, & Shen, 2008) covering 60 papers, 106 studies, and 372 effect sizes found robust support for the perceptual component of the third-person effect (the average effect size was $r = .307$).

Why Do People Perceive that Others are Influenced?

Given that the TPP disappears or even reverses itself when the topic under study is a media effect that is normatively positive (e.g., if asked to what degree a public service announcement or the media in general influence people to abstain from alcohol consumption before driving, people tend to believe they are at least as influenced as others, if not more so; Duck, Terry, & Hogg, 1998 – a finding dubbed the first-person perception), many scholars tend to explain the TPP as stemming from a motivation to view oneself positively (Gunther, Perloff, & Tsfati, 2008; Tal-Or &

Tsfati, 2007). Other evidence supporting our understanding of the TPP is that the gap between how powerful the media are expected to be in their influence on the self and on others depends on who these others are. The social distance corollary of the TPP states that the greater is the social distance between the self and the other who is perceived to be influenced by the media, the greater will be the gap in attributed media impact (Cohen, Mutz, Price, & Gunther, 1988).

There are, however, exceptions to the social distance corollary that are manifested when the others addressed have a unique connection to the message. When estimating the effects of media messages on members of a group that are expected to know more about the topic of the message, members of this group would be perceived as being less affected even if they are very socially distanced (Tsfati & Cohen, 2004), and if there is good reason to assume that they are especially vulnerable they may be perceived as especially affected even if they are more socially similar (Scharrer, 2002). These findings have been used by scholars to advance a cognitive explanation for the TPP.

According to the cognitive account of the TPP, people's perceptions of media impact are the result of their best guess, using what they know about the world in order to reach as accurate an answer as possible to a question to which even media scholars do not have the real answer. Cognitive explanations attribute errors in estimation not to self-serving biases but to more general cognitive biases. These include the attribution bias (people acknowledge the impact of external factors such as persuasive intent when they estimate the potentially undesirable impact of media on themselves, but when estimating that same effect on others, they concentrate on the innate characteristics of other people, such as gullibility; Gunther, 1991), and self-categorization theory (when people estimate media influence, they take into account what they know about the norms of the in-group and those of the out-group; Reid, Byrne, Brundidge, Shoham, & Marlow, 2007). According to one of the most studied cognitive explanations, people hold naïve theories of media influence. According to these "magic bullet-like" theories, greater exposure leads to greater media impact, and thus, when people estimate the impact of media content on others, they take into account what they know about the exposure of these other people to the specific media content. This explanation was called the perceived exposure corollary (Eveland, Nathanson, Detenber, & McLeod, 1999).

What are the Consequences of Perceiving Media Influence?

Davison's (1983) original interest in the TPP was predicated not on a fascination with the biased nature of human perceptions but rather on his claim that biased perceptions of media influence are the basis for social action and individual behavior. For example, he pointed out that movie censor boards who decide what is legitimate or illegitimate expression base their decisions on their (biased) fear that others would be harmed, whereas they are never concerned with the effect of screening these films

on their own morals or conduct. Likewise, it is now well established that biased perceptions of media influence underlie many other social decisions and actions. Such indirect media effects, the consequences of the perception of media impact, have been well documented as influence of presumed media influence or IPMI (Gunther & Storey, 2003), also known as the behavioral component of the third-person effect.

Recent reviews of the various contexts in which perceived media influence plays an important role provide a good summary of this research (e.g., Tal-Or, Tsfati, & Gunther, 2009). Such reviews point to a myriad of findings showing that people act based on their beliefs that media have effects on others to either protect themselves or others from such effects (e.g., Tsfati et al., 2005, show that parents restrict their children's TV viewing based on fears of detrimental effects), to coordinate their behavior to accommodate such media effects (Cohen & Tsfati, 2009), or to comply with normative pressures assumed to be the result of presumed media effects (Gunther et al., 2006). What is common to these studies is that they point to very real impacts of perceived media influence, a perception we know to be biased. Some of the consequences revealed in research are rather benign, such as having parents limit their children's TV viewing (Tsfati et al., 2005). Other consequences of the TPP, however, may be dangerous, as when teens claim to feel pressure to engage in sexual activity because they believe the media make this normatively expected, or rather important, as when voters change the way they vote (Cohen & Tsfati, 2009). And yet other effects may be life changing, as when people consider moving away from a town they perceived to be stigmatized by media coverage even though they enjoy living there. Thus, what at first seems like a curious self-affirming bias may have somewhat serious consequences.

Toward a Theory of Perceptions of Media

Thus far, we have defined and reviewed the causes and consequences of three perceptions regarding media: trust, hostility, and influence. But, besides the fact that these three perceptions are targeted toward the same object, are they related? Is trust in media at all related to hostile media perceptions, and are these two at all connected to perceptions of media influence? We argue that the answer to these questions is yes. From reviewing the three separate research traditions, we have learned that all three are at least somewhat irrational beliefs: while they incorporate relevant information, the motivation to all three is at least partially ego defensive. As we have shown, people who care more about a topic tend to be more defensive in how they understand media coverage of that topic. They thus tend to perceive the coverage as more hostile and influential and to increase their mistrust in the media.

The three questions underlying the three concepts – Are the news media trustworthy? Is news coverage of a given topic biased? What influence do the media in

general or a certain media content have on other people? – are not easy to answer even for academic experts deliberating for an extended period of time (and in the case of media effects, for decades). In that sense, the three perceptions cannot be expected to represent accurate assessments of media. That said, in all three cases it seems that people factor in what they do know about the world when they assess the media and their impact. There are cognitive factors involved in people's judgments of bias in a news story or the estimate of the impact of the story on others, and real-world events do influence people's trust in media (e.g., trust in media decreases after a predicted disaster does not take place; Major & Atwood, 1997).

There is an empirical association between the three perceptions as well. Tsfatı and Cohen (2005a) reported a significant association between respondents' perceptions of hostile news coverage and their trust in media, after controlling for a variety of political and demographic factors. Significant associations between hostile media perceptions and perceptions of media impact (on others) have also emerged in some other studies (Tsfatı, 2007; Tsfatı & Cohen, 2003), again after controlling for political and demographic covariates. That is, the more people mistrust the media, the more they tend to perceive media coverage as hostile to their point of view and the more they perceive news media to exert negative influence on others. It is important to note that these associations are statistically rather small. For example, in the settlers' data (Tsfatı & Cohen, 2005a), the partial correlation (controlling for various indicators of political ideology and extremity, religiosity, sex, age, years of education, and involvement – conceptualized as attachment to the particular settlement one lived in) between TPP and HMP was $r = .15$ ($p = .01$), the partial correlation between TPP and media trust was $r = -.10$ ($p = .07$), and the partial correlation between trust in media and HMP was $r = -.13$ ($p = .04$). Given the definition of trust, the association between the HMP and media trust is clear. If an individual thinks coverage is biased against her side of a story that is important to her (especially if this continues over time), it should come as no surprise that she does not trust the news media.

The empirical association between trust in media and the HMP on the one hand and the TPP on the other hand is somewhat harder to explain. It is well known in the TPP literature that perceived influence on others increases with the negativity of a text and its presumed influence (e.g., Tsfatı & Cohen, 2003; Tsfatı & Cohen, 2005b). Perhaps, then, mistrusted media are perceived as more influential because their effects are perceived as more negative for the evaluator: The more I mistrust the media, the more I see the news as biased, the more negative the messages seem, and the more severe I perceive their influence to be. In addition, though the studies documenting an association between hostile media perceptions, trust in media, and TPPs control for indicators of ego involvement, it is possible that the constructs are empirically connected because they share ego involvement as an antecedent. This could be the case especially if the controls employed in the analysis do not cover the full range of the meaning of "involvement." (For example, involvement in the settlers' study is conceptualized as time living in the settlements, having friends there, or feeling close to it. These indicators do not capture the variance in outcome-

relevant involvement as some settlers were about to lose not only their homes, but also their business or job as a result of the pending evacuation.) Finally, it is also possible that the shared object of the three perceptions can in and of itself explain the minor statistical associations between the constructs. Given that the media are evaluated in three different ways, some of the association between the constructs may stem from more general attitudes toward media underlying hostile media perceptions, media trust, and perceptions of media influence.

But trust in media, hostile media perceptions, and perceptions of media impact are not only empirically connected. As we have seen, they all relate to the way people respond to media and are thus connected through their consequences. Though all three perceptions may be flawed and inaccurate, they have very real consequences for individuals and for societies that increasingly rely on media to inform, entertain, and educate. Media have become central to our politics, economy, and social systems and, as such, how we regard them is crucial. Trust in media, the HMP, and the TPP are perceptions of media as social institutions that account for their motivation and power and sometimes trigger attitudinal or behavioral changes. To the extent that news media indeed exert influences on individuals and society, our perceptions of media play a key role in the process.

As we have seen, one of the realms in which all three perceptions have real-world consequences has to do with more general democratic trust. Trust in media was related to trust in democracy (Tsfati & Cohen, 2005a); hostile media perceptions were related to minority alienation (Tsfati, 2007); and perceived media influence was related to intentions to use force to thwart democratic decisions (Tsfati & Cohen, 2005a). A growing body of literature in communication research is concerned with the possibility that sensationalized, strategic, and cynical news coverage of political life (which itself has become increasingly commercial, personalized, and negative) is creating greater cynicism and apathy among voters (Cappella & Jamieson, 1997; Norris, 2001), expressed in decreased levels of political participation (Ansolabehere & Iyengar, 1997). The findings cited above imply that perhaps attitudes and perceptions of media do play a part in such effects. If people perceive their news coverage as biased, sensationalized, unprofessional, and unfair, and if these perceptions are coupled with perceptions of powerful media impact on other individuals and on society at large, then it is only logical that they would lose faith in the democratic process.

When considering perceptions of media in a volume on media effects, it is important to stress that the effects of perceptions of media are conceptually separate from the direct effects of a specific media text. Many of the consequences of trust in media, hostile media perceptions, and TPPs discussed above could and should be conceptualized as "media effects" because they represent attitudinal and behavioral changes that would have not occurred without the media and thus are caused by media. Whereas most traditions of research on media effects examine direct and intended effects, the effects of media perceptions covered in this chapter are often indirect effects, and for the most part they are unintended effects, not planned or even foreseen by

journalists, editors, and other producers of news media texts. Some of the studies demonstrated that these take place over and above the direct effects of frequency of exposure to media (Tsfati, 2007; Tsfati & Cohen, 2003), and in many cases the above-mentioned effects are not contingent on exposure but rather stem from knowledge or beliefs about the texts and media institutions that do not require frequent, continuous, and attentive exposure to news or other media content.

Rather than a stimulus–response model of media “effects,” the studies reviewed above point to a more complex process in which attitudes toward media shape responses to media and interact with responses to media. As we have seen, audience trust in the media seems to moderate some known media effects, such that the effects of media (e.g., agenda-setting effects) are stronger for trusting audiences and weaker for those mistrusting media institutions. This is not a surprising finding, as it stems directly from the definition of trust, yet it is an important one. In many ways, it echoes the claims by reception theorists about audiences’ ability to “resist” some of the persuasive powers of media texts (e.g., Livingstone, 1998; Morley, 1980). Audiences emerge stronger from research on the role of media trust in media effects, as well as from research on the consequences of hostile media perceptions and TPPs. They are critical and active, and they do not accept the media’s agenda and climate of opinion at face value. When they react to media portrayals, they incorporate what they think they know about media and their influences into their reactions. In this sense, the findings tell us that mistrust of the media, hostile media perceptions, and perceptions of media influence can be liberating.

Audiences may emerge from research on the consequences of media perceptions as more active, and perhaps more sophisticated, but they do not necessarily emerge as more sensible. Indeed, it makes sense that those mistrusting the media would be less willing to accept the media’s presentation of the world. Some effects of perceptions of media influence may also seem logical as they reflect coordination reactions to knowledge or expectation regarding the behaviors of others (such as in the case of changing one’s vote and voting strategically in part because media are perceived to have an influence on other voters). However, in many cases, audience reactions to their perceptions of media seem counterproductive. Consider, for example, the case of peripheral town residents who, despite liking their towns, considered moving away because they inaccurately perceived large effects of media on other people living in more central towns (Tsfati & Cohen, 2003). Evidence from this study demonstrated not only that people reacted to their perceptions of media impact, but also that these perceptions were grossly inaccurate (as evident from data collected in central towns, in which no evidence for media effects was documented). The fact that some of these people live their life with a desire to live elsewhere just because of naïve theories of media effects does not seem particularly functional to their well-being.

The main implication of this review is that we should probably pay more attention to perceptions of news media in media theory building. In addition to trying to explain audience mistrust of the media, hostile media perceptions, and TPPs, we

should also try to understand how these perceptions affect the interactions between news and audiences. The hypothesis that mistrust of the media moderates media effects should also be tested on other kinds of effects, such as media framing. The influence of presumed media influence should be tested in additional contexts, while more rigorously demonstrating the temporal sequence advanced by the theory. A more detailed explanation of the conditions under which people comply with perceived social norms fostered by media, and when they defy these norms, also seems warranted. Thus, as always, much is left for further research.

The Future of Game Studies

Mia Consalvo

ABSTRACT

The digital game industry has been evolving at a phenomenal rate and can no longer consider console games and the Western market as its primary areas of focus. Social games, casual games, virtual worlds, indie games, and online games all expand the boundaries of what count as games. Likewise, markets such as China and Korea and game development companies in Southeast Asia and Eastern Europe are challenging the dominance of Western and Japanese firms. How is game studies responding to such changes? Likewise, how is the field coalescing, now that there are dedicated journals, book series, conferences, and academic programs spread around the globe? This chapter explores how game studies has moved from “indie startup” to mid-career in its own growth trajectory of the last decade. It surveys how scholarship has evolved, what approaches have intentionally (or not) become dominant, and what views have emerged about the “proper” way to do game studies research. It concludes with challenges to the field, pointing to areas that have been overlooked, problems that remain, and the continuing question of the possibilities (and pitfalls) of making game studies research useful for popular and industry audiences.

Introduction

Most academic fields have traditions and canons that have evolved over decades (if not centuries), always being subject to scrutiny, but also bearing the increasing weight of tradition and expectation. Not so with game studies. As a new field, it is still in the process of inventing itself, just as the videogame industry itself is still working out how it should be structured, what genres dominate, and who its player base is or should be. When I first started researching videogames in 2001, the dominant model for the industry was appealing to hardcore gamers (primarily thought to be young males) through selling console systems at a loss, in order to generate an installed base large enough for game publishers. While few games researchers studied the logic of that model, most did accept the idea that men were the primary demographic of the industry, and “female gamers” were considered a rare find, with tastes confusing to standard designers. In regard to game content, discussions of *Tomb Raider*, *Myst*, and *Doom* often encompassed much of the discourse about games. Such limited foci have obviously changed – the industry itself has transformed, rejecting its almost blinkered focus on console games to now create a mixed array of games and platforms, designing new categories of games such as casual games, social games, and massively multi-player online games (MMOGs), and rushing to populate new platforms such as Facebook, the iPhone, and the iPad. And if games have always been a profitable industry, they are increasingly valuable. The Entertainment Software Association has reported that US videogame software sales for 2009 generated \$10.5 billion, and that 67% of US households now play digital games (ESA, 2011). And apart from the traditional industry, Facebook officials have stated that approximately 40% of usage time on its site (with its 400 million + users) is spent playing games (Siegler, 2010).

Academics studying games have begun to structure a history for this field, drawing from the work of the Dutch cultural historian Johann Huizinga and the French sociologist Roger Caillois for help in understanding concepts such as “play” and “game.” Game scholars have deepened their work, theoretically and methodologically, and have moved from limited effects models and marginalization to a robust field of inquiry and critique. Yet scholars are just beginning the process of establishing game studies as a field. This chapter explores that developing landscape, pointing to some of the more important developments in scholarship on games, as well as challenging future researchers in this area to expand their research and make it more relevant, not just for the field, but for everyone who makes and plays games.

A Prehistory of Game Studies

Game studies has a curious relationship to past work done relative to videogames. Although Aarseth (2001) declared 2001 “year one” in computer game studies, he was,

either purposefully or not, ignoring nearly three decades of social scientific work on video and computer games. Part of that move was likely political: the move did decisively break with work done primarily on the negative effects of videogames relative to violence and gender stereotypes. But it also sought to claim ground for the study of games apart from traditional disciplines, theories, and methodologies.

Some of the earliest research (and perhaps the most infamous in the popular media) is the effects-driven approach to studying players of violent videogames. For example, Anderson and Ford (1986) ran experiments to establish how videogames deemed highly and mildly aggressive affected players. While they found that “hostility was increased in both game conditions” (p. 390), it is also important to note that they classified the 1982 arcade game *Zaxxon* as “highly aggressive” (p. 395), despite its lack of blood or realistic images, suggesting that criteria for what counts as aggressiveness in games have evolved, making it difficult to build off past research.

The effects tradition draws heavily from past work on other media forms, including film and television most centrally. Scholars have built on past work, exploring if and how videogames with violent content can cause increased aggression and create the potential for violence in players (Anderson & Bushman, 2001; Anderson & Dill, 2000; Anderson & Ford, 1986; Hartmann & Vorderer, 2010). While some meta-analyses have questioned such a link and its statistical significance (Sherry, 2007), proponents still claim measurable effects, which they believe will become stronger as games become more realistic and immersive (Anderson & Bushman, 2001).

Yet there are consistent challenges to these studies from several areas, including from effects researchers themselves (see Sherry, 2007). One concern is the short duration of exposure to games in the studies, with most experiments less than 30 minutes in duration. In looking to determine if longer exposure would provide different results, Williams (2006) conducted a study of *Asheron's Call 2* players (an MMOG), finding mixed results: family relationships were unaffected, but prior friendships eroded; news media use was unaffected, but other entertainment media were “displaced” by online play (p. 651). Other researchers have raised different concerns, including Ferguson, whose studies suggest instead that “family violence and innate aggression as predictors of violent crime were a better fit to the data than was exposure to video game violence” (Ferguson, Rueda, Cruz, Ferguson, Fritz, & Smith, 2008, p. 311). Ferguson also argues that many effects researchers are more focused on creating a moral panic than finding the real causes of violence such as school shootings (Ferguson, 2008). Indeed, Anderson and Bushman's 2001 article begins by listing the locations of several school shootings and stating, “the shooters were students who habitually played violent video games,” making the link very clear (p. 363).

Other game studies scholars question the assumptions that underpin effects theories and experimental research writ large. Researchers including Henry Jenkins (2006), Jim Gee (2007), and Janet Murray (1997) have all argued that in contrast to seeking out quantifiable effects on players, we should look at how individuals *use* videogames, and the pleasures as well as frustrations that might be a part of that play. In one of the first examples of such research, Gareth Schott found that among

youth in New Zealand, playing violent games offers many pleasures, even as players themselves contend with the negative atmosphere surrounding their activities. For example, he writes that one game, *Dead Rising*, “offers players an opportunity to resist the forces that control social spaces” (Schott, 2009, paragraph 22). Thus, instead of employing a passive construction implying little resistance on the part of the individual, research taking this approach demonstrates there is more at work than a simplistic input–output model between game and player.

Another early focus was content, with scholars taking various approaches to studying what was “in” popular videogames of the time, particularly Nintendo’s games. One of the best known early books, *Video Kids: Making Sense of Nintendo* by Eugene Provenzo (1991), was mostly an attack on games of the time for their limited range of images and reliance on violence as a central facet of play. By contrast, Marsha Kinder’s (1993) *Playing with Power* provided a more balanced study, applying a psychoanalytic approach to popular children’s entertainment, linked to a structural analysis of how videogames were weaving themselves into the fabric of the entertainment industry. Her findings were not all negative – while she did point to gender stereotypes and a preoccupation with violence, she also considered that games might be a positive way for children to work through various issues or stages of their development into adulthood.

Such work was indeed part of the history of studying videogames, but it also led to one of the larger splits that emerged in the field. On one side were effects researchers working comfortably in home disciplines including psychology and sociology, and on the other side were humanists and others who believed that the study of games demanded different methods and theories, and that players were not passive objects to be acted upon by all-powerful games. Some attempts have been made to seek common ground between the two approaches, but mostly they exist in parallel to one another without much crossover. That is because many of the assumptions that underlie each approach, both theoretical and methodological, can be diametrically opposed.

In response, more recent researchers have started studying players as active participants in the gameplay process, constructing and negotiating the meanings that games offer to them. And they have also taken new approaches to examining games, trying to establish how the varied components of game – narratives, representations, gameplay mechanics – are all key in understanding individual games as well as genres and other types of games. How that research has evolved, and how it has impacted both the field of game studies and new media studies generally, is detailed next.

Videogames are Special, and Not Special

Case 1: Games are Special

Within the field of game studies itself, perhaps the oldest argument stemming from the “games are special” belief is the debate between narratology and ludology, and

which approach should have primacy in the study of games. More detailed discussions of this debate exist elsewhere (Frasca, 2003; Murray, 2005; Pearce, 2005) and I will not reproduce them here. But there are a few key points that are important to highlight, as they touch on the heart of what it means to study games and game players.

Central to the original position of narratology is the belief that games can become something greater than they are – they can become more truly interactive, engaging works of art. Much of that depends on games' abilities to deliver fictional works that are the equivalent (in some undefined sense) of other forms now considered artistic, such as the novel or film. Janet Murray's (1997) call for a *Star Trek*-like experience detailed in *Hamlet on the Holodeck* is a major proponent of this approach. While this is an aspirational call (note the emphasis on how games *can become* rather than *are*), others in the narratological tradition would argue that games do have stories as important elements, and we can study games using tools and theories from related disciplines, perhaps with some adaptations (Simons, 2007).

In contrast, ludologists have generally argued that games are more than storytelling narratives and, further, that games should not strive to be stories or even worry about narratives. What makes games special is their interactivity – the fact that they are indeed ludic – and require “non-trivial effort” on the part of the player to be experienced (Aarseth, 1997). As such, they cannot be studied using the traditional methods or theories of fields such as comparative literature or film studies. Indeed, scholars such as Eskelinen (2004) have been polemical in arguing that narratology “is not completely useless” but is helpful only in terms of how it can enhance ludology and “the features inherent to games” (p. 38). Eskelinen has also decried the supposed “colonization” of the study of games by other fields, writing that “resisting and beating them is the goal of our first survival game in this paper, as what these emerging studies need is independence, or at least relative independence” (p. 36). Yet aside from the political boundary marking to establish a new field and define it as important, there are a few key points to take from this debate.

Most importantly, we can recognize that games (and gameplay itself) can be quite difficult to study from a methodological standpoint. Setting aside notions of active and passive audiences first mentioned in media studies in regard to television viewing, games do require active engagement by players in order for them to come into being. Further, the more active games encourage players to be (in the form of greater numbers of choices, whether these be storyline options or even gameplay possibilities), the more complex they become as objects of inquiry. Likewise, while representations and narratives can be key parts of games to study, gameplay itself must be taken into account for games to retain their ludic quality. Finally, another key consideration is the role of the researcher: should it be to objectively watch others play, or to engage with a game herself? These are important questions that have arisen from the ludologists' point of view.

Second, and in line with the narratologists, we must not omit the study of narratives or stories from our understandings of games. As my own work has demonstrated, players often cite the stories in games as a critical element in their enjoyment,

and for some players, games must have a strong storyline or narrative to hold their interest, or even to motivate their gameplay in the first place (Consalvo, forthcoming). Game developers themselves are often driven to create games with strong stories such as *Choice of the Dragon*, *Mass Effect*, and *Final Fantasy*, and have also experimented with different ways to tell those stories, such as the ambient storytelling method used in games such as *Half-Life* and *Portal*. Clearly, from a player and developer perspective, stories or narratives do have a place in games, and thus how they fit (or not) should be actively studied by researchers as well.

Finally, no one discipline or field should (or can) have control over game research or theorization, and the study of games is enriched by multiple paths of inquiry. Narratives are not the only important elements of games to study, nor are game mechanics. Scholars working in fields as diverse as law (Burk, 2005; Lastowka & Hunter, 2004), philosophy (Ess, 2009; Reynolds, 2002), anthropology (Boellstorff, 2010; Malaby, 2009), art history (Sharp, 2010), sociology (Simon, 2006; Taylor, 2006), computer science (Mateas, 2004; Wardrip-Fruin, 2009), and other areas have all contributed much to the study of games, drawing from their own disciplinary perspectives yet also adapting those practices to the study of ludic practice. Such activities bring us a much more varied, rich, and valuable account of games and game players than one discipline or field (whether communications or game studies) ever could on its own.

Case 2: Videogames and Research on New Media

In addition to research focused on games and play, work done in game studies has also been important in helping us understand developments in new media more broadly. There are connections in multiple areas, including the development of interactive fiction, identity play as it happens online, the formation of online communities, the rise of user-generated content in relation to Web 2.0, and the game industry's role in the global spread of popular culture, to name only a few areas.

In his history of interactive fiction, Nick Montfort (2005) writes of the centrality of games in the development of the genre. In doing so, Montfort makes the case that games can function as literature and can be considered works of art equal to other expressive forms. He goes on to clarify that while interactive fiction may not have much in common with the novel, "the riddle, like an IF [interactive fiction] work, must express itself clearly enough to be solved, obliquely enough to be challenged, and beautifully enough to be compelling" (p. 51). Games that incorporate such riddles have helped to shape and popularize the evolution of interactive fiction (with interactive fiction likewise shaping game development), and games have contributed to that art form in important ways, even as they have eclipsed interactive fiction in terms of popular attention. Yet he also believes that "studies of one of these types of systems will surely yield results about textual and interactive properties that will apply to the other" (p. 224).

The study of games has also contributed findings and led to important theorization in the area of identity play and identity formation online. Much early work exploring how individuals negotiate and experiment with various aspects of their identities was based on the study of online game spaces. Most popularly, Turkle (1995) has written about various multi-user domains (MUDs) and how individuals have used them to create different personas in order to experiment with a different identity, and perhaps to integrate new elements into their real-world personalities. Other scholars have likewise focused on game-based MUDs as sites for gender exploration (Bruckman, 1996) as well as sexual identity play (McRae, 1996). While such work initially led to early celebratory accounts of individuals liberated from static, solitary identities (Stone, 1995), recently we have seen more balanced accounts emerge, suggesting that identity play is not as prevalent as earlier thought (Consalvo, 2010; Lüders, 2010). Nevertheless, forms of identity play can still occur online, and games are popular spaces for that activity. Nakamura (2000) has written about negative forms of identity play, such as racial stereotyping in early online games and virtual spaces, or what she refers to as “identity tourism.”

Alongside identity play, research focusing on games has given us important insights into online communities, and how they develop as well as evolve and die. One of the earliest graphical online games, *Habitat* (released in 1985), showed its creators the unique challenges of managing online communities composed of diverse individuals (Morningstar & Farmer, 1991). As the developers explained in their subsequent writings about the game, they quickly learned that “we could influence things, we could set up interesting situations, we could provide opportunities for things to happen, but we could not predict nor dictate the outcome.” Morningstar and Farmer tried to take as hands-off an approach as possible, and kept their interactions with residents primarily within the fiction of the game.

Similarly, players of the early MMOG *Ultima Online* challenged the game’s creators in unexpected ways (infamously one player, Rainz, managed to kill the game developer’s avatar, Lord British, while he was visiting the virtual space), with those developers likewise learning the importance of managing community as part of a game’s world (Bartle, 2006). Dibbell (1993) recounts the history of the more socially themed MUD LambdaMOO, and how one particularly famous incident (with Mr. Bungle) led to debates about the role of democratic processes in virtual worlds and the potential rights of players as citizens of that space. That topic sprung up again more explicitly with Raph Koster’s famed “Player’s Bill of Rights” written in 2000 (Koster, 2000). Such calls for some type of representation, as well as for the acknowledgment that activities in online games and virtual worlds do matter, have found their way to most other online spaces as well. Yet games have been an important playground for their early development, and games research has done key work in highlighting such movements.

More recently, game ethnographers such as Taylor (2006), Pearce (2009), and Boellstorff (2010) have investigated the communities found in online games and virtual worlds, and have detailed the key role that such formations play in the existence of

such spaces. Pearce (2009) in particular explores how the affordances of particular virtual worlds will shape how individuals and groups play within them, and how the different spaces come to shape their virtual and physical identities. Such research is valuable not only for what it tells us about virtual worlds, but also for how it helps us understand how individuals and groups interact with one another in different kinds of spaces, and the ramifications of living a life increasingly online.

Other game researchers have drawn important linkages between the history of games and the (now popular) concept of user-generated content. Those studying mods, such as Sihvonen (2009) and Sotamaa (2009), detail how gamers have played a pivotal role in the development of content for games, creating a role for themselves somewhere between consumer and professional producer – perhaps the “produser” that Bruns (2007) refers to – but which is increasingly recognized as valuable by the game industry. Sihvonen (2009) in particular details how early player-created mods for *Doom* generated expectations among game developers that players would demand such content, so that mod tools and level editors became a regular, expected element of many games. That expectation has become a larger part of Internet use, as other researchers have illustrated (Jenkins, 2006), particularly in relation to the concept of the “participatory culture” that can emerge relative to media texts that audiences hold dear.

Finally, game research has explored how global media industries are not always dominated by Western products or producers, as the case of Japan’s early leadership in the game industry demonstrates (Consalvo, 2006). While earlier media industries, including film and television, have often featured Western control of markets and the inability of other countries or cultures to compete with entities such as Hollywood, the game industry shows another industry configuration. Early console and arcade history featured companies and software produced in Japan, North America, and Europe most centrally, while more recently there has been an upsurge in production in South Korea, China, and parts of Eastern Europe. Such developments speak to the importance of studying global media, and how such media travel and mutate as they cross various cultural and national borders. Given the recent fragmentation of the television industry and increasing practices of runaway production in the film industry, the games industry and research about it offers another model for understanding the complexity of contemporary global media and their audiences.

Methods and their Meanings

For scholars interested in studying particular videogames, the following scenario might seem familiar, as it illustrates many of the issues that studying games themselves raises in terms of methods of analysis. Playing the latest game in the *Dream Chronicles* series, *Book of Air*, I am faced with a choice before beginning – to play in casual mode, or to try the “challenging” option. Casual mode includes easier puzzles

and the option to skip them if they still prove too difficult. Likewise, I have the option of buying the Collector's Edition and getting additional bonus material, including an extra level to complete; or waiting a few weeks for the cheaper, standard version without those bells and whistles. I wonder how many players try each version of the game, and whether such differences matter to the experience of gameplay. Launching the game brings back memories of past games in the series, prompting me to ask if I can consider this game on its own merits or if past games in the series should be studied as well. For example, the prior game allowed the player to travel to different locations in any order desired, as long as she solved all of the puzzles, unlocking the final challenge in the game. This game is more linear, only allowing me to progress from one area to another by completing the level, which then unlocks coordinates for the next location. The game's story is integrated fairly well with gameplay challenges, but it still relies on traditional narrative elements at times. These are all things to consider when studying what is in a game itself.

Considering the context of my play, other complexities emerge. When I play, I am usually on a laptop, either at home on my couch or traveling, playing with earbuds in. I do not play in windowed mode, to avoid interruptions. Of course there are other interruptions and distractions to contend with, such as the dog barking or the noise of the television. As a player I may not consider such issues important, but as a researcher I must ask if those interruptions matter in deconstructing the gameplay experience, either to understand a particular game itself, or how various players might take meaning from it. Likewise, I could ask if the overall gameplay experience is different for someone who plays in short bursts of time over perhaps a month compared with someone who downloads, plays, and completes the game in one sitting – a matter of less than 10 hours. Finally, is my own experience of play enough to draw from to best understand the game, or should I talk with, interview, or survey other players? Likewise, I may ponder which players I am interested in and how I can find them. These are all questions that arise as researchers face the challenge of studying games.

To undertake such research, academics from disparate fields have faced the challenge of choosing the best methods for answering such questions. Although recently we have seen the development of methods particular to studying gameplay, initially there were no such approaches to draw from. Thus many scholars turned to their home disciplines for help in understanding how players interacted with games, and what “effects” or impacts those games might have on players.

Choices of method are never divorced from the theoretical approaches that scholars draw from, and the study of games and players is no different. Because of this, specific methodologies in game studies have varied widely, with researchers drawing from a variety of fields (including education, law, psychology, sociology, communications, and anthropology) in order to find ways to best study their objects of interest. Some of those methods have included content analyses and textual analyses of games, rhetorical studies of player chat, surveys of players, experiments with players as well as observations in laboratories, virtual ethnographies of MMOGs and virtual

worlds, interviews and focus groups with players as well as developers, and other methods that researchers are still developing. More specifically, many media studies scholars have drawn from active audience theories and have used textual analysis as a method for studying individual games. Anthropologists have used ethnographic methods to investigate virtual worlds and MMOGs and their player communities. Sociologists have studied player groups, psychologists have investigated the cognitive processes of players, and English as well as literature and film scholars have used various theories such as poststructuralism, deconstruction, and reader response theory to understand the world of videogames. And as game studies has evolved, researchers have increasingly come to advocate that games should be treated as different from other popular media and that we need newer tools and theories as well as approaches to best understand games.

Methods choices also tend to align with a researcher's particular theoretical home. So those who draw from critical and cultural theories, for example, usually ask questions best answered using qualitative methods, while social scientific research is more inclined to use quantitative approaches. There is some multi-methodological research being conducted as well, but it remains relatively rare compared to other approaches (Williams, Kennedy, & Moore, 2011). Still, it is helpful to discuss the various types of methods that have been chosen and that have evolved in game studies research over the past decade, to identify their advantages and disadvantages, and also to demonstrate how methods could evolve to help us better understand the dynamic nature of games and gameplay.

Many of the earliest methods used to study games and players were quantitative, designed to offer breadth rather than depth in data. Many early researchers used quantitative content analysis in order to investigate the images and representations offered in early videogames (Dietz, 1998; Kinder, 1993; Provenzo, 1991). Content analysis was an obvious way to get started and also offered baselines for future research. Most early work focused on depictions and levels of violence, and also investigated the presence of gender stereotypes as well as the (somewhat rare) presence of female characters. Those early studies found that female characters were indeed few and far between, with games treating the few actual female characters as either princesses in need of saving or as eye candy for the presumed male player (Dietz, 1998). Such studies also investigated the prevalence of violence, with Provenzo decrying "the consistent tendency toward the depiction of violence and aggression that is so much a part of the games included in the Nintendo system" (1991, p. 134). Such findings are not that surprising given that one of the earliest games developed was *Spacewar!* in 1961, suggesting that violence and games have a long history, and activities such as shooting and killing are deeply embedded in the history of the medium.

But while content analyses offer a broad view of many games, they are limited in how much content they can sample from individual games – usually 10 to 30 minutes at most, and almost always from the beginning of the games sampled. Perhaps more problematic, however, is the reliance on studying representations rather than game-

play. Most of the gender studies have focused on the appearance of the female characters (or their absence), with a nod to their role in various games – as trophy, as victim to be saved, as eye candy. Some researchers (Children Now, 2001; Williams, Martins, Consalvo, & Ivory, 2009) note the ability to play as a female character or not (thus being the driver of the action and affording the female character agency), yet mostly the focus is on images, which are admittedly problematic. Some studies of violence have examined the options offered to players, such as whether the game offers varied ways to deal with conflict, including negotiating, violence, or other ways; or if violence seems justified or not, or if the player is usually rewarded for engaging in violence (Smith, Lachlan, & Tamborini, 2003). However, there are still many questions left unanswered, including how players make sense of that violence, as studies like Schott's (2009) are beginning to explore.

Other early methods used by games researchers have included surveys and experiments. Some of the best known work includes survey research done by Nick Yee in his Daedalus project, an ongoing survey of players from a variety of MMOGs from 1999 to 2004. Gathering the views and self-reported practices of approximately 35,000 players, Yee (2010) has found wide-ranging results about the basic demographics of players, motivations for play, relationships between avatars and player identity, addiction, relationship formation, and gender-bending. These data paint a picture of the average MMOG player as approximately 26 in age, with about half of all players working full time and playing games an average of 22 hours a week. Although much of Yee's work is about gathering baseline information, it does come to some interesting conclusions, for example that "the two primary reasons why players gender-bend are to be able to be more stylish and to optimize their character."

Most other survey research is not as broadly based, but is instead usually limited to the players of a particular game. More recently, Williams, Consalvo, Caplan, and Yee (2009) reported the findings of a study of *Everquest 2* players, drawing from a survey that was hosted by the game's publisher – Sony – and was presented to all players before their login screen. The resulting data yielded some interesting differences in terms of player-reported interests and activities, suggesting that researchers must take the results of non-random samples cautiously, as it is usually the most motivated and dedicated players who most often respond to requests for interviews, surveys, and general questions for more information.

Meta-Methodological Concerns

There are several challenges associated with methodological choice, however. First, whether studying games as game texts or players and their activities, it can be very difficult to take account of the interactivity of videogames. Games demand effort in order to be experienced. So a game is not quite like a book or television show, with only one central story and one linear path through it. Instead, games can feature no story at all, they may have multiple branching paths that change the experience, and

players themselves have the ability to alter some games, not only through their choices in game but perhaps through user-created modifications that can be either minor or major changes to the game and its world. Studying only the representational content misses major aspects of the experience. Thus, a key concern in game studies has been to advocate for study of the gameplay elements of games – how mechanics work, how players make choices, what choices games offer, and how those elements can intertwine with representations, narratives, and player agency. By adding those elements to the mix, game studies can tell us more about why people play games, how players might use them as playgrounds to think through ideas and actions, and how they can function as a space players use for relating to one another. But first we need to get a better sense of how to study games, to see them as more than one more form of media their users are exposed to in daily life.

One such approach is Bogost's procedural rhetoric. Arguing that the most successful persuasive games build their arguments into gameplay itself, Bogost (2007) offers numerous examples of how such a process works. One example he uses is the flash game *Tax Invaders*, which allows the player to control an image of George W. Bush's head as he shoots down enemy tax proposals. Bogost writes that despite its seeming simplicity, "the battle is both metaphoric and material – the player actually does battle against taxes, in a literal sense. [...] In playing the game, the player is encouraged not only to reaffirm a conservative position on taxation, but also to practice using a conservative frame for that position" (p. 108). Such examples help us see how games have meanings as part of their procedurality, rather than simply being formed in the text itself, via a story or narrative. Such methods for exploring those meanings are critical for the future of game studies.

Methods: Continuing the Debates

As we develop (and refine existing) methods for studying games, certain practices have become standardized, allowing us to question or make way for additional considerations. Game studies scholars have largely accepted the charge that one must actually play the games one is studying or using in studies to measure or observe player behavior. Without the knowledge of how a particular game is played – if, for example, a researcher is merely watching a recorded gameplay session much like one might watch a television episode – critical errors in analysis can result. For example, one early study of violence in videogames had the control subjects play a game that was qualitatively different from the violent game that the test subjects played (they used *Myst* and *Doom*), making accurate comparisons difficult if not impossible (Anderson & Dill, 2000). Similarly, without playing a game researchers might not understand the level of difficulty involved, or the feel of play, which can also be important.

Finally, this charge has opened the door for considering additional questions: How much should a game researcher play a game? Should we always finish the games we

study? If the game does not have an official ending, such as MMOGs, how much should we play? Should we be able to beat the game on various difficulty levels, and likewise, should researchers cheat when they play (consult walkthroughs, use codes), particularly if they are not exploring the way that cheating works in a game? How much should we know about the political-economic structure of the companies that make such games or that structure the larger industry? These are many questions that game studies researchers, particularly those interested in critical and cultural approaches, are still pondering.

Questioning Origin Theories

If game studies is to break with other disciplines to establish itself as a serious field of study, it needs its own theories for understanding play and games, which help us better understand the human condition and the role of play (and games) in our lives. To do so, researchers in game studies have looked to scholars who have conceptualized and studied different types of games (not merely digital games), as well as the historical role of play in human social interaction. Theorists studying games include Huizinga (1950), Caillois (1961), Suits (1978), and Fine (1983), with work on non-digital play by Sutton-Smith (1997) being influential as well.

Such writers provide helpful ways to think about games as more than media products. Caillois (1961), for example, creates a taxonomy for games that includes four types that can be combined: *agon* (games of competition), *alea* (games of chance), *ilinx* (games of vertigo), and *mimesis* (mimicry or role-playing) (pp. 14–26). Such categories can help us categorize or compare games of like or unlike type, as well as position digital games alongside card games, board games, and so on. Suits (1978) offers extended discussions of how to define the term game, as well as the meaning of cheating or being a spoilsport or a trifter in a game, definitions that inform contemporary player behavior in videogames. Gary Alan Fine's (1983) ethnographic study of paper and pen role-playing gamers prefigures the activities of MMOG players to a startling degree, suggesting commonalities in how groups come together – physically as well as virtually – to engage in social activities.

Here, however, I focus on a more recent discussion in game studies, namely the usefulness of one of the field's core concepts – the magic circle – first discussed in relation to games by Johan Huizinga (1950). Huizinga's larger project was to advocate for the centrality of play in human life. He argued that play is older than culture, and has formed a kind of template for many aspects of civilization, if we look deeply enough. Activities such as war, law, art, language, and philosophy, according to Huizinga, have a play element at their core. And central to that play element is the magic circle. For Huizinga, play is set apart from daily life, both temporally and spatially, although the spatial aspect may be a liminal, or transitory, form of everyday space, rather than a physically delineated boundary such as a boxing ring or baseball

diamond. According to Huizinga, “all play moves and has its being within a play-ground marked off beforehand either materially or ideally, deliberately or as a matter of course” (p. 10). In that space, he writes, “the laws and customs of ordinary life no longer count” (p. 12).

In seeking to define what makes games different, game studies scholars have often pointed to the magic circle as a way to distinguish play activities from other aspects of daily life. The magic circle boundary appears to make sense, particularly if a player is engaging in an offline multi-player game, or even a single-player game that is online or offline. The rules define the boundaries of the game, and the player must abide by those rules when in the space of the game. The concept has been popular with game designers, such as Katie Salen and Eric Zimmerman (2004), who have used it in their widely cited game design book, *Rules of Play: Game Design Fundamentals*, to talk about how to conceptualize the space of a game, and how players approach games as seemingly unique artifacts with distinct rules for engagement. They write, “the magic circle of a game is the space within which a game takes place. Whereas more informal forms of play do not have a distinct boundary, the formalized nature of games makes the magic circle explicit” (p. 99).

Some game studies scholars are in agreement with such distinctions. For example Castronova (2004) has argued in relation to virtual worlds that “any threats to the magic circle are also threats to a person’s well being. The magic circle warrants protection by some means, one of which might be the law” (p. 185). Yet other scholars have begun to question both the easy applications of the magic circle concept to videogames (as opposed to non-digital forms of games) and the usefulness of the concept at all for explaining video gameplay. Marinka Copier (2007) provides an extensive discussion of the subject in her doctoral dissertation, concluding that the magic circle concept

refers to a preexisting artificiality of the game space that, combined with the strong metaphor, creates a dichotomy between the real and the imaginary which hides the ambiguity, variability, and complexity of actual games and play. [...] I posit that even rules alone do not create a preexisting artificiality. Games need to be played, and players actively influence each other as well as what the system of the game becomes. Thus the game-play experience is always the result of the interplay between different cognitive frameworks on rules, play, and culture. (p. 139)

Other scholars take similar positions, including Taylor (2006), who studies the intersections of play activities as individuals move back and forth between the play space of MMOGs and the physical space of their daily lives, and Malaby (2006), who argues that “it is how we have sought to account for what is remarkable about games by setting them apart (as play-spaces, as stories) that is the largest roadblock to understanding what is powerful about them” (p. 97).

Lehdonvirta (2010) states that in relation to MMOGs and other virtual worlds, treating such domains as separate is extremely problematic, as once one starts

cataloguing the caveats to how to count population, how to distinguish users from avatars, spillover of social relationships and the like, the process becomes shot through with exceptions and problems. Instead, Lehdonvirta (2010) advocates for considering such spaces as *social worlds*, a concept drawn from sociologist Anselm Strauss.

Liebe (2008) takes a somewhat different approach to dismissing the magic circle for videogames, arguing that “players do not have to adhere to the code of behavior and the rules, but simply have *no other choice* than to act within the frame of the possibilities provided by the computer program” (p. 332, emphasis added). But Juul (2008) maintains that while some may see the magic circle as a useless concept, it is still necessary to understand player activities, since “the magic circle is the boundary that players negotiate” (p. 62). In my own writing on the topic (Consalvo, 2009a), I agree that players do negotiate various aspects of play, yet suggest another concept that might be more useful in understanding such activity – the notion of frames, as introduced by Erving Goffman and modified to fit the gameplay situation by Fine (1983). This modification suggests that there is no easy distinction to be made between the ordinary rules of life and when they do or do not apply. Instead,

players exist or understand “reality” through recourse to various frames (their daily life, the game world, their characters’ alleged knowledge and past) and move between those frames with fluidity and grace. So, rather than seeing a boundary break or simply being “inside” or “outside” a magic circle, by conceptualizing gamer activity as movements between frames, we can better capture and study the complexities of MMO gameplay. (Consalvo, 2009a, p. 415)

Such diverse and robust attention to this concept indicates that game studies as a field continues to evolve. Scholars studying digital games take their relationship to non-digital games, as well as the experience of gameplay, quite seriously. How this matter will be resolved is still an open question, suggesting a key debate for the future of game studies.

One Possible Future for Game Studies

Copier began exploring the development of the field of game studies as early as 2003, at the time of the first conference of the Digital Games Research Association in Utrecht, the Netherlands (Copier, 2003). Certainly the field has evolved since she wrote on the subject, but some elements remain the same. Game studies scholars continue to stake ground for themselves, as Copier suggested as a characteristic of all new fields. Part of that work involves setting boundaries – defining what is “outside” is just as critical (perhaps more so) as defining what is “inside” the field.

The time of Aarseth's 2001 proclamation declaring the beginning of game studies was a key moment in the process of establishing the field's boundaries. Researchers in Europe and North America had begun studying and writing about games using qualitative and critical methods, and had started to scrutinize games as unique objects. At the same time, researchers looked at the tools they had been trained with via their relative disciplines, and wondered if they were adequate to the job. A central question emerged: what is the best way to study games? Game scholars are still debating that question more than a decade later.

During that time, however, the makings of a field, if not a discipline, have begun to emerge. The online journal *Game Studies* was launched in 2001, and the Digital Games Research Association was formed in 2002, holding its first conference a year later. Other journals devoted to games have been created, including *Games and Culture*, *Eludamos: Journal for Computer Game Culture*, *International Journal of Role-Playing*, *International Journal of Computer Games Technology*, and *Journal of Virtual Worlds Research*, to name a few. Likewise, book series have developed at presses including MIT Press, Routledge, Sage, and other important venues. DiGRA has continued to hold semi-annual conferences, the Canadian Game Studies Association has been formed, and numerous smaller games conferences have been held around the globe. Finally, colleges and universities have started full-scale departments of game studies and design (such as the Georgia Institute of Technology and the IT University of Copenhagen in Denmark), while many others have created undergraduate programs in game design, or worked to create interdisciplinary programs stressing game design and game studies.

Research has become specialized and sustained, with scholars carving out areas of expertise and engaging with questions and problems in increasingly sophisticated ways. Yet where should the field go next, as games scholars establish better methods and theories? Writing in *Eludamos*, I have already questioned the structures that game studies has created in its drive to establish itself as a serious scholarly endeavor (Consalvo, 2009c). Likewise, I have called for more research on the business aspects of digital games and virtual worlds, more studies of virtual worlds targeted to children, and more studies of the global aspects of games (Consalvo, 2010). These remain viable concerns, and there are also others that demand equal if not greater attention, including areas of study, terminology and practices, and the communication of results.

One of the most important, if not most pressing, is the challenge to adapt research methods as well as develop better ones to understand the complexities of both games themselves and game players. Many of these issues have already been addressed in this chapter but deserve highlighting here. We are only beginning to understand how individuals play games and the meanings derived from that activity. There is currently little in the language of game studies to account for such experiences – witness debates about whether or not games are merely “fun” or whether they are solely escapist entertainment. This is not a problem specific to game studies – media studies scholars have also grappled with how to draw meaningful insights from audience

members, who are taught from a young age to denigrate their own consumption practices of popular culture. Games, however, are usually even lower on the status list than television and film, and thus have an even greater uphill battle to fight, still often being pigeonholed as “for kids” and “not serious.”

Even studying the act of play is challenging. As Taylor and Witkowski (2010) remind us, we have done little to theorize playing spectatorship and what that might mean for different types of player/spectators. Are there ways to engage with a game without holding a controller and guiding it? How can that engagement be measured? How do relationships between players and spectators influence gameplay or the gaming situation? We need much more study of different types of play, beyond looking at how players fall into categories such as achievers, explorers, and socializers.

Likewise, game studies needs better guidance in studying how games are produced, in terms of both design-based research and how business and cultural practices shape game design. Beyond studying balance sheets or observing the development process, how can design itself be a research tool? What would success or failure in that regard look like? And finally, game studies scholars should continually question the reliance on industry terms to define their research. As my own work indicates, terms such as “casual” and “female player” are largely meaningless (Consalvo, 2009b), given that female players have diverse play styles, interests, and practices, and many players of “casual” games can be quite dedicated to their playing, spending multiple hours with the games.

Related to this, but more broadly, game studies should widen the scope of analyses, to see how play and games are integrated into the everyday lives of individuals, groups, and communities. Although it is difficult enough to study games in isolation, they are not played in isolation, except perhaps in the test labs of game researchers. As Radway (1988) suggested in relation to earlier media audiences, individuals do not focus their attention solely on one text; instead they live their daily lives, and media are an important element, but only one part of it. Similarly, games are only one slice of most folks’ lived experiences, yet research often treats those experiences as singular, isolated, and special. For many people, games probably are not that special. Research on mobile games is beginning to show just that (Parikka & Suominen, 2006). Yet we also need to account for how games are part of that wider scope of daily experience. For example, Kolos (2010) found that the daily practices of a dorm community centered on playful experiences rather than on specific videogames. Yet she would have missed that more important finding had she only questioned individuals about their gameplay habits. While such deep explorations can be insightful, we need more such studies, which help us see where games fit in the rhythms of a person’s or a family’s life; how that group influences the styles of play witnessed; and how particular games might foster or even challenge those styles. Such studies are necessarily bigger and more difficult to do, but they would offer a better picture of the role of games in everyday life, of how their ordinariness can also be special.

Related to this, game studies scholars need to respond to the increasing gameification of life we see emerging. Products such as Foursquare and sites such as Chorewars are only the beginning – if games are seen as motivating to individuals, and people strive to earn badges and achievements for almost anything, we will see this practice grow, as Schell (2010) and Hecker (2010) have warned. Yet aside from the ramifications of entertainment games, and our purchasing habits, what might this mean for daily life? Huizinga argued that play preceded culture and was deeply structured into many of the institutions and practices we think of as serious (including law, war, and sports). What will such consciously crafted game-like systems mean for people in terms of being good citizens, careful parents, or interested media audiences? Game researchers need to investigate this trend, before its prevalence overtakes what we know about its effects.

We must put to rest the concept of the “gamer.” Games are ubiquitous, and this concept is more exclusionary than helpful in scholarly conversations as well as in identifying how individuals envision games in their lives. Except for the most hardcore, there is little benefit to labeling oneself a gamer, and a host of stigmas attached. One prevalent stereotype of the gamer is the slacker with negligible social skills, alone in his parents’ basement, grinding away at violent, gory, and sexist videogames. Most of us know the stereotype is not accurate, but for many individuals who play an astonishing amount of games, this is what being a gamer means. Just as people now watch television or go to movies, they also play games – whether on consoles, computers, or mobile phones, on board games, with cards, or using physical objects such as balls and hoops. Using the term gamer sets up artificial distinctions and creates tensions where instead we should be making connections. To do that, game scholars should move away from gamer as an identity marker and instead focus on how games or play make people’s lives more interesting, richer, better, and even more frustrating at times.

Lastly, even as scholars become more specialized in their knowledge domains (studying casual games or MMOGs, looking at the effects of violent games or exploring design practices in serious games), they need to keep the broader research picture in mind. Already there are interesting convergences in the study of female players – whose activities are strikingly similar across casual, MMOGs, and social games. Where else will we see such commonalities, or what could be important differences? Likewise, game studies must continue its conversations with other fields and disciplines. Most centrally, I believe games studies scholars have important things to say to their home disciplines as well as related fields of study – such as in the domain of online behavior that Internet studies scholars scrutinize, or ways to enrich conversations in anthropology when it comes time to conduct a virtual ethnography, as Pearce (2009) has done. Even as games are special and need more specialized methods to be understood, research findings can and do speak to broader communities of knowledge, and game scholars must be forceful in making that known. In that way, games studies makes the case that games do matter, and that play is central to the experience of being human. Our play activities are critical to map and understand, and

they also play a role in the rest of our daily activities. They help to shape our cultures, our senses of ourselves. They are increasingly being mapped onto daily living. How could we *not* study games?

The Decline of Modern Journalism in the Neo-Partisan Era

Richard Campbell

ABSTRACT

Today's media market is a fragmented world where more options than ever exist, but where newspaper readers age and TV viewers embrace cable news, social networks, blogs, and Twitter. The former "mass" audience morphs into smaller niche users who chase particular hobbies, entertainment, and politics. Media outlets that hope to survive appeal not to mass audiences any more but to interest groups – from sports fans and history buffs to conservatives or progressives. So, mimicking the news business of the eighteenth century, partisanship has returned with a vengeance, more profitable than ever. For the news media, muting political leanings to reach a mass audience makes no sense when a mass audience no longer exists. Instead, media now make money by targeting and catering to niche interests. In such a marketplace, we see also the decline in a US journalism that promoted fact-gathering, documents, and expertise, and held up "objectivity" as the ideal for journalistic practice. Rising in its place is a new era of partisan news – a "journalism of assertion" – marked partly by a return to journalism's colonial roots and partly by the deterioration of the "journalism of verification" that kept watch over our central institutions. This transition is symbolized by the rise of the news pundit as a kind of "expert" with more standing than verified facts, authentic documents, and actual experts. Today the new partisan fervor found in news outlets online and on cable has perhaps been the major catalyst for the nation's intense political and ideological divide. For news to move forward in such an era, we need to reinvigorate the "news of verification," teaching students to break free from static older formulas – especially in TV news – and to reimagine the telling of significant stories in compelling ways.

It may not be essential to save or promote any particular news medium, including printed newspapers. What is paramount is preserving independent, original, credible reporting, whether or not it is popular or profitable, and regardless of the medium in which it appears.

(Downie & Schudson, 2009)

Writing for *Rolling Stone* in March 1992, media critic Jon Katz foresaw the authority of modern newspapers being usurped by a variety of “new news” or postmodern forms that combined information, entertainment, opinion, and analysis. Katz (1992) claimed that the authority of the most prominent daily papers, such as the *New York Times* and the *Wall Street Journal*, was being challenged by “news” coming from talk shows, sitcoms, popular films, rap music, and – add to that today – various Internet sites, 24-hour cable news shows, and Comedy Central’s *The Daily Show* and *Colbert Report*.

Katz was partly correct back then, but what he did not foresee was the rise of intense partisanship in news media, especially in 24/7 cable news and on Internet blogs. For much of the nineteenth and twentieth centuries, news outlets tried to appear neutral and appeal to the largest audience possible. This was a profitable strategy for journalism. So why in the twenty-first century has journalism returned to its old partisan roots? Today we have the ongoing feuds between cable news channels, along with the 24/7 blogosphere attacks on both the right and the left. Partisanship itself is making the news today.

What is most intriguing about this intense partisanship is the way it recalls the press of yesteryear. Newspapers in the eighteenth century, subsidized by their political parties, cultivated a nasty partisanship, rivaling and even surpassing today’s venom. Alexander Hamilton and Thomas Jefferson ran papers in which they attacked each other. Newspapers referred to President George Washington at various times as “a horse beater,” “a dictator,” “a most horrid swearer and blasphemer,” “a spoiled child,” and “a tyrannical monster” (Lewis, 1991, pp. 54–55; Burns, 2006, pp. 178–179).

But by the nineteenth century the press started to strike a more detached and moderate tone in its reports. In the 1830s, when the telegraph first enabled news to instantly crisscross the country, journalism began moving away from partisanship and the seeds of modern journalism were sown. To complement the new technical advances, editors called for a focus on the immediacy of the present. Modern print journalism de-emphasized political discussions and historical context, instead accenting the new and the now. Historians mark this period in the 1830s and 1840s as the beginning of the transition from the partisan to the modern press era. Though US journalism began as a venue for partisan politics (with papers taking one side or the other in debates over issues such as constitutional amendments, slavery, and states’ rights), in the nineteenth century publishers figured out how to sell news more profitably as a product. They used modern technology – including the rotary press and cheaper paper – to substantially cut their costs; they also began to change news

content to appeal to emerging and literate middle- and working-class people, who could now afford a paper and had some leisure time to read one. Publishers realized that they needed more practical and current everyday content that appealed to readers across the political spectrum.

Ironically, the key reason for the current neo-partisanship in our news media is economics, just as a neutral stance was “good business” in the nineteenth and twentieth centuries. Partisanship is profitable again. Today’s media marketplace is a fragmented world where there are more media options than ever. Network TV news has lost more than half its viewers in the last decade to cable news, social networks, blogs, and Twitter. Newspaper readership also continues to age and decline, as young readers turn to Facebook, online news aggregators like Google and Yahoo!, and their smart phones. The former mass audience is morphing into smaller niche users who chase particular politics, hobbies, and forms of entertainment. Media outlets that hope to survive must appeal not to mass audiences but to interest groups – to conservatives or progressives or sports fans or history buffs or reality TV addicts. For the news media, muting political leanings to reach a mass audience makes no sense in a world where a mass audience no longer exists. Instead, news media now make money by targeting and catering to niche interests.

What created the 1990s crisis in the authority of traditional newspapers was complicated, but the changes Katz identified were real. Reporters then (and now) were often regarded with suspicion – as grim doomsayers who only report on life’s seamy underbelly; as peeping-tom invaders of celebrity culture and personal privacy; as shady plagiarizers who make up quotes and fabricate sources; as cynical critics of revered national leaders; as smug semi-professionals disconnected from the everyday problems of working people; or as opportunistic polarizers interested only in pitting left against right in superficial dramas. In fact, in Gallup public opinion polls measuring people’s confidence in journalism from the early 1990s and to the late 2000s, respondents who said they had “a great deal” or “quite a lot” of “confidence in newspapers” dropped from 40% to less than 25% (Morales, 2010).

As recently as the 1970s, many newspapers were highly regarded – particularly the *Washington Post* – viewed as major players in toppling a corrupt White House administration during the Watergate scandal. By the mid-1970s, journalism schools overflowed with students eager to take up careers in this noble profession, which, at its best, served as a serious check on the abuses of governmental and institutional power. But since those heady days of Watergate, journalism’s reputation has declined dramatically in the public eye.

Part of the decline is explained by a public – and many journalists – who came to distrust the so-called “objective” ideal of journalism, which had been held up as a professional goal for most of the twentieth century. Of course, journalism was always a narrative endeavor, not some sort of “objective” data set. Journalists interpreted the world, made choices about which experiences to cover (and which to exclude), and rendered them not as scientific reports but as news *stories*. In addition, TV news began exposing the print ideal in the 1950s. The narrative point of view in the news

shifted away from print's detached third person ("The Senate yesterday voted 52–48 to raise taxes by 5 percent on middle-class Americans") to broadcasting's personal first person ("Well, our taxes are going up again"). In the 1950s and into the twenty-first century, TV news anchors became "stars" and celebrities, invited into people's living rooms each evening to deliver the news personally. Viewers knew them by their first names (Walter, Peter, Tom, Brian, and Diane), whereas print journalists were often faceless, anonymous, and as detached as their front-page point of view. In eroding the more detached print model, news became more conversational and intimate, paving the way for news celebrities: "talking head" cable pundits like Sean Hannity and partisan Internet bloggers like Matt Drudge. In a fragmented marketplace, those journalists and pundits who tell the loudest and most dramatic stories have begun spooning small but profitable pieces from the news media pie as the mass audience turns to menu items that feed their individual interests.

In such a news food court, we are witnessing the accelerated decline of an era of mainstream US journalism that promoted fact-gathering, documents, and expertise, and held up "objectivity" as the ideal for journalistic practice. Rising in its place is a new era of partisan journalism – a "journalism of assertion" – partly a return to journalism's colonial roots and partly the deterioration of the "journalism of verification." This transition is marked by the rise of the news pundit as a kind of "expert" with more standing than verified facts, authentic documents, or actual experts (see Kovach & Rosenstiel, 2007, pp. 78–112). In addition, today the new partisan fervor found in news outlets online and on cable has made a major contribution to the nation's intense political and ideological divide.

The Roots of the Objective Ideal and Journalism's Modern Period

Although the objective ideal in journalism is associated with the twentieth century, the early commercial and partisan press did in fact provide some impartial coverage of events. These papers often carried verbatim reports of presidential addresses, murder trials, or the annual statements of the US Treasury. In the late 1800s, this journalistic ideal was overshadowed as newspapers pushed for circulation and emphasized "sensational" stories about scandals and corruption, especially in New York. By the late 1890s, as media sociologist Michael Schudson (1978) has noted, two distinct types of journalism were competing for readers: a story model, advanced by the penny and yellow press, which dramatized important events and told stories about people's personal lives, and an information model, advocated by the six-cent papers, which emphasized an approach that appeared more factual (pp. 88–120).

As the consumer marketplace expanded nationally during the Industrial Revolution, facts and news became marketable products. Throughout the mid-1800s, the more a newspaper appeared not to take sides on the front page, the more its readership base

could be extended (although editorial pages were often rabidly supportive of particular political candidates). In addition, wire-services organizations were serving a variety of newspaper clients in different regions of the country. To satisfy all their clients and a wide range of political views, newspapers needed to appear more impartial.

The ideal of an impartial, or informational, news model was championed by Adolph Ochs, who bought the *New York Times* in 1896. Ochs's staff of editors rebuilt the paper around substantial news coverage and provocative editorial pages. To distance themselves from the yellow press, the editors downplayed entertainment news and sensational features, favoring the documentation of major events or issues. Such distancing was partly a marketing strategy to counter the large mass circulations of the Hearst and Pulitzer papers. Ochs offered a distinct contrast to the more provocative newspapers: an informational paper that provided stock and real-estate reports to businesses, court reports to legal professionals, treaty summaries to political leaders, and theater and book reviews to intellectuals. Ochs's promotional gimmicks took direct aim at yellow journalism, advertising the *Times* under the motto: "It does not soil the breakfast cloth." The strategy of the *Times* was similar to many TV marketing plans today that target upscale, 18- to 49-year-old viewers who spend a disproportionate share of consumer dollars.

At the dawn of the twentieth century, with publishers interested in expanding readership and reporters adopting a more detached "scientific" posture toward news- and fact-gathering, the ideal of objectivity began to anchor journalism. Under the banner of "objective" or modern journalism, which distinguishes factual reports from opinion columns, reporters strive to maintain a neutral attitude toward the issue or event they cover; they also search out competing points of view among the sources for a story. Civil War correspondents developed the so-called inverted pyramid style of reporting by imitating the terse, compact press releases that came from Lincoln's secretary of war, Edwin M. Stanton (Mindich, 1993, 1998). Often stripped of adverbs and adjectives, such reports began, as they do today, with the most dramatic or newsworthy information, straightforwardly answering who, what, where, and when questions at the top of the story (and less frequently, why or how).

By the 1920s the *New York Times* had become the official "paper of record," the standard that other newspapers emulated and that libraries throughout the country stocked to document daily occurrences. Filled with the texts of treaties, court reports, political speeches, and other national documents, the *Times* became more than a powerful alternative to the storytelling of earlier papers; it became the official way to do journalism in the 1900s. The modern reporter evolved, ideally, as a detached and neutral observer who gathered information and adapted it to informational or so-called objective formulas.

For much of the twentieth century, this "inverted pyramid" news style served as an efficient way to arrange a timely story. As journalism educator John Merrill (1971) once pointed out, the wire services that used the inverted pyramid style when distributing stories to newspapers nationwide "had to deal with large numbers of newspapers with widely different political and regional interests. The news had to

be 'objective' [...] to be accepted by such a heterogeneous group" (p. 240). Among other things, the importance of objectivity and the reliance on the inverted pyramid signaled journalism's break from the partisan tradition. Although difficult to achieve, the notion of objectivity nonetheless became the guiding ideal of the modern press.

Despite the financial success of the *New York Times* and other informational papers, the more factual approach toward news came increasingly under criticism. In the 1920s, progressives like Walter Lippmann thought that news had become too descriptive and needed more analysis (Lippmann, 1920). Assessing 1960s mainstream print journalism, the *New York Times*' Tom Wicker (1978) argued that inverted pyramid journalism reported "mostly the contents of official documents, or statements delivered by official spokesmen," and had become entrenched as the dominant journalistic model, presenting "statements only in the most obvious terms" (pp. 3–5). The press, Wicker noted, "had so wrapped itself in the paper chains of 'objective journalism'" that it could report very little beyond "bare and undeniable" facts (pp. 3–5). Michael Schudson (1978) argued that by the end of the 1960s "objectivity in journalism, regarded as an antidote to bias, came to be looked on as the most insidious bias of all. For 'objective reporting' reproduced a vision of social reality which refused to examine the basic structures of power and privilege" (p. 160). The criticism continued. As Poynter news writing coach Roy Peter Clark (1984) once noted: "Some reporters let the pyramid control the content so that the news comes out homogenized. Traffic fatalities, three-alarm fires, and new city ordinances all begin to look alike. In extreme cases, reporters have been known to keep files of story forms. Fill in the blanks. Stick it in the paper" (p. 47).

News Values, Individualism, and Conflict: The "Story" of Modern News

Even though journalists transform events into stories, many generally still believe, despite criticism, that they are – or should be – neutral observers who present facts without passing judgment. Conventions such as the "inverted pyramid" news lead, the careful attribution of sources, the minimal use of adverbs and adjectives, and a detached third-person point of view all help reporters perform their work in a supposedly neutral way. Like lawyers, therapists, and other professionals, many modern journalists believe that their credibility derives from personal detachment. Yet the roots of this view reside in less noble territory. Critic Jon Katz (1993) has discussed the history of the neutral position:

The idea of respectable detachment wasn't conceived as a moral principle so much as a marketing device. Once newspapers began to mass market themselves in the mid-1880s, after steam- and rotary-powered presses made it possible to print lots of papers and make lots of money, publishers ceased being working, opinionated journalists.

They mutated instead into businessmen eager to reach the broadest number of readers and antagonize the fewest. [...] Objectivity works well for publishers, protecting the status quo and keeping journalism's voice militantly moderate. (p. 32)

To reach as many people as possible across a wide spectrum, then, publishers and editors realized as early as the 1840s that softening their partisanship might boost sales.

"Neutral" journalism remains a selective process. Reporters and editors turn some happenings into reports and reject many others. This process is governed by a deeper set of subjective beliefs that are not neutral. Sociologist Herbert Gans (1979), who studied the newsroom cultures of CBS, NBC, *Newsweek*, and *Time* in the 1970s, generalized that most US reporters and editors share several basic "enduring values," including ethnocentrism, responsible capitalism, and small-town pastoralism.

But for Gans, individualism was the most prominent value underpinning daily journalism. Many idealistic reporters are attracted to this profession because it rewards the rugged tenacity needed to confront and expose corruption. Beyond this, individuals who overcome personal adversity are the subjects of many enterprising news stories. And certainly our culture's interests in individual achievement and notoriety help nourish media's obsessions with particular celebrities. Unfortunately, journalism that focuses mainly on the personal fails to explain how large institutions work or fail. Many conventional reporters and editors are unwilling or unsure of how to tackle the problems raised by institutional decay and organizational dysfunction. While journalists possess the narratives for telling the tales of prominent or extraordinary individuals, they often don't have ready formulaic narratives to frame social problems or institutional complexity. In addition, because journalists are accustomed to working alone, many are uncomfortable cooperating on team projects or participating in citizen forums.

Traditionally, as Michael Schudson (1978) has argued, reporters have aligned facts with an objective authority and values with subjective feelings. Within this context, news reports offer readers and viewers details, data, and description. It then becomes the citizen's responsibility to judge and take a stand about the social problems represented by the news. Given these assumptions, modern reporters are responsible only for adhering to the traditions and rituals of their trade – "getting the facts" and rendering them as "objective" accounts. As a result, many reporters view themselves as neutral "channels" of information rather than as citizens themselves, actively involved in telling the stories that help shape our perceptions of public life.

By the end of the twentieth century, the neutral or objective ideal had been fully exposed and journalists faced harsh criticism from the right, the left, the center – and from comedians who served as equal opportunity satirists of news media and the major characters they covered. As critics and audiences grew more cynical, people found comfort in "news" outlets that were decidedly partisan. Audiences went in search of stories that affirmed their politics and confirmed their values. News outlets sought to tell and sell stories that captured audiences' growing mistrust of "neutral"

journalism. Back in a 1963 NBC staff memo, Reuven Frank, NBC news division president, got to the actual heart of journalistic practice: storytelling. He outlined a narrative strategy integral to all TV news: "Every news story should [...] display the attributes of fiction, of drama. It should have structure and conflict, problem and denouement, rising and falling action, a beginning, a middle, and an end" (Frank, 1965, p. 276). Despite Frank's candid insights, most journalists were uncomfortable thinking of themselves as storytellers, even though storytelling is the main cultural frame through which people make sense of their everyday experiences. For much of the twentieth century, journalists viewed themselves mainly as fact-gatherers or information conduits, trying to distance themselves both from partisanship and from the storytelling mandate of their daily jobs.

Most journalists, and journalism educators, came to define news by a conventional set of textbook criteria for determining newsworthiness: information most worthy of transformation into news reports. Although other elements could be added to the list, news criteria generally have included timeliness, proximity, prominence, human interest, novelty, and deviance. But the real heart of journalistic storytelling is *conflict* – the key ingredient in any good fictional story. As Herbert Gans (1979) noted in his seminal study of news values in the 1970s, modern journalists were socialized professionally into setting aside, as best they could, their political views and personal opinions in order to select and develop news stories based on different combinations of these criteria. The bottom line for most mainstream journalists became telling a good story – full of conflict – not necessarily covering important social issues, and certainly not advancing a partisan position.

Driving the news selection process, issues and events that seem timely or new take precedence. Reporters cover speeches, meetings, crimes, or court cases that have just happened. In order to rate as news, most of these events also have to occur close by, or in proximity to, readers and viewers. Although slimmed-down local papers used to offer more national and international news, readers and viewers today find the bulk of news devoted much more to their own towns, communities, and regions – sometimes called "hyperlocalism." The decline of national and international news has much to do with the downsizing of local and regional papers, whose declining advertising base has forced most of them to shrink their size, their content, and their staffs.

In addition to the near and the new, prominence and human interest play a role as well. Reader and viewer surveys indicate that most people identify more closely with a person than with an abstract issue. And stories need characters. Therefore, the news media tend to report stories on powerful or influential people who serve as those central characters. Because these individuals often play a role in shaping the rules and values of a community, journalists have traditionally been responsible for keeping a watchful eye on them. But reporters also look for unusual "human interest" topics: extraordinary incidents that happen to ordinary people. In fact, good reporters can often relate a story about a complicated issue by illustrating its impact on one person or family.

News is also often about the novel and the deviant, and about characters involved in novel or deviant events. When events happen that are outside the routine of daily life, such as a Congresswoman shot at a political rally, a bride running away from her impending marriage, or a priest on trial for molesting boys, the news media are there. Reporters are routinely assigned to cover events that deviate from social norms, including murders, rapes, fatal car crashes, fires, and political scandals.

Finally, and most importantly, news topics are transformed into narratives that contain a healthy dose of conflict – a key ingredient in fictional and nonfictional storytelling. In fact, in developing news narratives, reporters are encouraged to seek contentious quotes from those with opposing views. For example, stories on any presidential election almost always feature dramatically opposing Republican and Democratic views. National issues like social security, healthcare, and global warming are typically covered as two-sided arguments, often favoring and featuring two positions from the most extreme or dramatic points of view. *Newsweek's* Evan Thomas (2008) pushes this point further, arguing that the “real bias” in news is not political but professional. He contends that what drives most news reports is the search for conflict and character:

The press's *real* bias is for conflict. Editors, even ones who marched in antiwar demonstrations during the Vietnam era, have a weakness for war, the ultimate conflict. Inveterate gossips and snoops, journalists also share a yen for scandal, preferably sexual. But mostly they are looking for narratives that reveal something of character. It is the human drama that most compels our attention.

Although newsworthiness criteria are a conventional way to define news, they also reveal much about the cultural aspects of news. As culture, news is both a product and a process. It is *both* the morning paper, evening newscast, or the online blog *and* a set of subtle values and shifting rituals that have been adapted to historical and social circumstances, such as the partisan-press ideals of the 1700s and the informational model of the twentieth century. As culture, then, mainstream journalists are socialized into the process of gathering information and making narrative reports that offer selected frames of reference. In constructing those frames, reporters must meet deadline pressures, while also trying to help the public make sense of prominent characters, key events, and the central tensions of the moment.

The Transformation of Reporting Rites in the New Partisan Era

In the new partisan era, represented especially by evening cable news shows, it has become more acceptable for guest journalists not only to report information but also to take stands, make judgments, and promote their own publications. In the early

days of cable news, newspaper reporters were discouraged by their editors from appearing on these shows and thereby compromising their neutrality. However, over time, editors and publishers saw cable appearances as a way to promote their newspapers. Prominent national reporters, thanks to their exposure on cable news, have become celebrities themselves.

To reach this point, however, a stock of modern reporting rituals had to be incorporated into the new era. Developed during journalism's modern twentieth-century era, they include (1) overemphasizing the present, (2) getting the "good" story, (3) relying on expert sources, (4) reducing events to "two-sided" dimensions, and (5) confronting leaders and institutional representatives who are covered in reporters' daily rounds. In fact, these rituals have become compatible with the new partisan era, supporting the individualism of journalists and the centrality of conflict and character in their stories.

First, as members of an emerging modern profession, journalists in the twentieth century drew criticism for failing to offer historical analyses of important phenomena. In news stories about drugs, for example, individual characters – dealers, addicts, abusers, police, medical experts – passed through the frame of news. However, once these characters were no longer timely, they no longer served the narrative requirements of daily news. Urban drug stories heavily dominated print and network news during the 1986 and 1988 election years. Such stories, however, had virtually disappeared from the news in 1992 and 1994, although the nation's serious drug and addiction problems had not diminished (see Reeves & Campbell, 1994). Drug stories simply became "yesterday's news." Modern journalism tends to reject "old news" for whatever new event or idea comes along. In the mid-1990s, when statistics revealed that drug use among middle-class high school students was rising, reporters again latched onto new versions of the drug story during the 1996 elections, but their reports made only limited references to the 1980s. And although drug problems and addiction rates did not diminish in subsequent years, these topics were virtually ignored by journalists during more recent national elections. Indeed, given the space and time constraints of daily journalism, reporters seldom link stories to historical contexts.

In the new partisan era, with the emergence of 24/7 news cycles, the emphasis on the new and the now has intensified. Not only do traditional newspaper and TV reporters cover tabloid-style stories, but cable pundits and Internet bloggers now analyze them for days and weeks, offering cynical and repetitive partisan interpretations, as when US Representative Anthony Weiner got caught sending sexually explicit photos to young women on Twitter and Facebook. When the Democratic House minority leader said that in a live press conference she would focus not on the Weiner scandal but on job creation and the dismal economy, all the cable news services – Fox News, CNN, MSNBC – turned away from her remarks and declined to cover the proceeding.

In addition to the preoccupation with the present, a second ritual – "getting the good story" – remains as central in the new era as it did in the old. In the Weiner

case, three major cable news services concluded that the “good story” was the House Democratic speaker commenting on a discredited, scandal-ridden legislator and not one on the economy and jobs. According to Don Hewitt (personal communication, February 21, 1989), who created *60 Minutes* in 1968, “There’s a very simple formula if you’re in Hollywood, Broadway, opera, publishing, broadcasting, newspapering. It’s four very simple words – tell me a story” (see also Hewitt, 2001). For most journalists, then, the bottom line is getting a “good” story, an edict that overrides most other concerns.

Journalistic scoops and exclusive stories try to portray reporters as heroes of their own stories: they have won a race for facts, which they have gathered and presented ahead of their rivals. It is not always clear, though, how the public is better served by a journalist’s claim to have gotten a story first. Certainly, enterprising journalists can get a story started by calling attention to an important problem or issue. But on occasion, as with the July 1999 plane crash that killed John F. Kennedy, Jr., his wife, and his sister-in-law, scoop behavior leads to “herd” journalism, which occurs when reporters stake out a house or follow a story in such large groups that the entire profession comes under attack for invading people’s privacy and exploiting personal tragedies. Although readers and viewers might value the tenacity of adventurous reporters, the earliest reports are usually not better than stories written days later with more context and perspective.

A third ritual of modern print journalism – relying on outside sources – has made reporters heavily dependent on experts. Columnist Jonathan Alter once called such sources the “usual suspects.” Alter (1985) contended that “the impression conveyed is of a world that contains only a handful of knowledgeable people. [...] Their public exposure is a result not only of their own abilities, but of deadlines and a failure of imagination on the part of the press” (p. 69). This lack of imagination and the reliance on official sources signal another vulnerability in traditional journalism. Critics during the first Gulf War back in the early 1990s noted that once the war started, voices of dissent virtually disappeared from television news. Perhaps even more alarming, in a two-week study in early 2003 that looked at the major news networks and PBS’s *News Hours* program – before the war against Iraq started – Fairness and Accuracy in Reporting (FAIR, 2003) found that 76% of all 393 sources used were former or current government (or military) officials. Only 17%, or 68 on-camera sources, expressed skepticism about the war, at a time when most polls showed that more than 60% of US citizens favored a diplomatic solution to the crisis. Only three sources in this study – less than 1% – represented organized antiwar groups.

By the late 1990s, many journalists were also being criticized for blurring the line between remaining neutral and being an expert. While former shows like CNN’s *Crossfire* once pitted opinionated columnists and reporters against one another, the boom in 24-hour cable news programs in the late 1990s created a demand for talk programs featuring interviews with journalists willing to give their views on the hot story of the day, rather than more expensive at-the-site reporting. In covering major media events, print journalists now appear several times a day on cable programs

acting as experts, not only offering the facts they have gathered but providing opinion and speculation as well. Some editors have even encouraged their reporters to go on these shows in the hope of selling more magazines and newspapers. The *Washington Post*, for example, routinely provides a set for its reporters who appear on television that prominently features the paper's logo behind its reporter of the moment. Many critics contend that these practices erode the credibility of the profession by blending journalism with celebrity culture and commercialism.

In the new partisan era, experts abound alongside pundits, bloggers, and cable hosts. With the 24/7 news cycle, the great demand for experts who provide their opinions fills up time, inexpensively. It is now simply harder to tell who is an expert and who is not. Pundits, bloggers, and hosts often comment on key issues and events without providing supporting evidence or documentation and without revealing how they know what they know. The relatively cheap cost of these programs, coupled with their appeal to lucrative niche partisan markets, has further destabilized the already shaky neutrality ideal of modern-era journalism.

For many journalists of the modern era, neutrality simply meant telling two sides of a story. This notion that news is two-dimensional represents a fourth taken-for-granted ritual of the news process. A reporter sent to cover tax increases or local crime might be given this editorial advice (as I once was): "Interview Republican and Democratic leaders from the district and have them fight it out in the story." Such "balance" is a narrative device that helps generate story conflict. For most journalists, balance means presenting all sides of an issue without appearing to favor any one position. Unfortunately, because time and space constraints do not always permit representing multiple sides, in practice this value has often been reduced to "telling both sides of a story." In recounting news stories as two-sided dramas, reporting often misrepresents social issues that are complex and multidimensional. The abortion controversy, for example, is almost always treated as a story that pits two extreme positions (anti-abortion vs. pro-choice) against each other. People whose views do not fall at either end of the spectrum are seldom represented.

In claiming neutrality and inviting readers to share in their detached perspective, journalists circumvent their own values. The authority of their third-person, all-knowing point of view (a narrative device that many novelists use) enhances the impression of neutrality by making the reporter appear value-free. The claim for balanced stories, like the claim for neutrality, disguises journalism's narrative functions. After all, when reporters choose quotes for a story or news photographers choose camera angles, these are usually the most dramatic or conflict-oriented words or images that emerge from an interview, press conference, or public appearance. Choosing quotes or images often has more to do with enhancing drama than with being fair or establishing neutrality. The balance claim – at least for much of the twentieth century – had been in the financial interest of modern news organizations. William Greider, a former *Washington Post* editor, made the connection between good business and balanced journalism back in 1988: "If you're going to be a mass circulation journal, that means you're going to be talking simultaneously to lots of

groups that have opposing views. So you've got to modulate your voice and pretend to be talking to all of them" (quoted in Hertsgaard, 1988, p. 78).

Again, the new partisan era marks a shift away from courting "mass" audiences to chasing niche markets. In fact, today it often pays to be one-sided. For example, CNN, which has more reporting resources than other cable news networks, still tries to balance or modulate its voice in the evening, adhering to the old model of "telling both sides" of a story with the host and reporters generally striking a neutral pose. Fox News, however, goes after conservative viewers, while MSNBC courts liberals and progressives. While these cable outlets often bring opposing points of view into their stories, the scales are tipped by the star pundit hosts, who appeal to their audiences and in the end take partisan stands, not neutral ones.

Complementing the search for conflict, the fifth ritual is the one that journalists take much pride in: their adversarial relationship with the prominent leaders and major institutions they cover. The prime narrative frame for portraying this relationship is sometimes called a "gotcha" story, which refers to the moment when the reporter confronts a villain or corners a wrongdoer. This narrative strategy is frequently used in political reporting. Some journalists assume that leaders are hiding something and that the reporter's main job is to ferret out the truth through tenacious fact-gathering and tough questions. An extension of the search for balance, this stance locates the reporter in the middle, between "them" and "us," between political leaders and the people they represent.

Critics of the tough-question, bulldog style of reporting argue that it fosters a cynicism among journalists and actually harms the democratic process. Although journalists need to guard against becoming too cozy with their political sources, they sometimes go to opposite extremes. By constantly searching for what politicians may be hiding, reporters may miss other issues. News scholar Jay Rosen (1992) has argued that "the essential problem is that the journalist's method of being critical is not disciplined by any political vision" (p. 6). In other words, the bottom line for neutral or conventional journalists, who claim to have no political agenda, is maintaining an adversarial stance rather than improving the quality of political stories and discussions. When journalists employ the gotcha model to cover news, being tough often becomes an end in itself. Thus reporters believe they have done their job just by roughing up an interview subject.

In the new partisan era, the bulldog role is being usurped by the radio and TV commentators who pronounce their various positions, but often with little or no supporting evidence or on-site reporting to verify or ground their opinions. This is what Bill Kovach and Tom Rosenstiel (2007) have called the "journalism of assertion," contributing to a toxic "public sphere" that "has become an arena solely for polarized debate, not for compromise, consensus, and solution" (p. 86). They contrast this with the "journalism of verification" – what for them is "the beating heart of credible journalism," which is about doing disciplined reporting, citing reliable documents, and finding significant evidence. In their view, modern objectivity, fairness, and balance are *not* the goals of journalism; they are simply "techniques," "devices,"

and “methods” for “testing information” in order to achieve a “transparent approach to evidence.” For Kovach and Rosenstiel, “the journalist is not objective, but his method can be” (p. 78); they argue that the cornerstone of journalism education should be “the study of evidence and verification” (p. 83). Similarly, *New York Times* editor Bill Keller (2011), writing about WikiLeaks, champions the value of impartial, nonpartisan journalism, which is increasingly at risk: “Your obligation, as an independent news organization, is to verify the material, to supply context, to exercise responsible judgment about what to publish and what not to publish and to make sense of it” (pp. 46–47).

Differences Between Print and Television News

In the 1950s and 1960s, with the ideal of “objectivity” already under siege, the institution of journalism was significantly altered as television introduced new styles to the news delivery. TV news began to take journalistic practice in directions that ran counter to the objective model. This was partly accomplished merely by the shift in narrative point of view, with TV anchors telling stories from first- and second-person points of view and offering a conversational, more intimate presentation of news. In the new partisan era, both the personal point of view and the emotional displays by cable pundits and online bloggers are descended from TV news. But many blame early television and now cable for blurring the boundary between entertainment and information – an updated two-sided version of the late nineteenth- and early twentieth-century battle between story and information print models.

From about 1955 through 1957, the three major television networks – ABC, CBS, and NBC – moved their entertainment divisions to Los Angeles, in part because of its close proximity to Hollywood production studios. Network news operations, however, remained in New York. Symbolically, these cities came to represent the two major branches of TV programming: entertainment and information. The shifting rules and rituals of US journalism were encapsulated in the career of former radio reporter John Daly, host of the CBS game show *What’s My Line?*. When he began moonlighting as the evening TV news anchor on ABC, the fledgling network blurred the so-called entertainment and information border, foreshadowing what by the 1990s had become a central criticism of journalism.

Officially, print news came under the full spell of television with the arrival of the colorful *USA Today* in 1982, radically changing the look of most major US dailies. This new paper incorporated features closely associated with postmodern form, including an emphasis on visual style over substantive news and the use of brief fragmented news items that appealed to readers’ short TV-era attention spans. *USA Today* represents the only successful launch of a new major US daily newspaper in the last several decades. Showing its marketing savvy, *USA Today* was the first paper to pay grudging tribute to TV’s increasing influence on journalism. Marketers at the

paper even designed its vending boxes to look like color TV sets. *USA Today* also has preferred the present tense of broadcast style (“he says”) rather than print’s past tense (“she said”).

Although TV news reporters share many values, beliefs, and conventions with their print counterparts, television has transformed journalism in a number of significant ways. Whereas modern print journalists have been expected to remain detached and relatively anonymous, TV news has always linked its credibility to live, on-the-spot reporting, believable imagery, and viewers’ trust in the anchors who read the news. In fact, since the early 1970s, the annual Roper polls have indicated that the majority of viewers find TV news more credible than print news. Many viewers have tended to feel a personal regard for the local anchors who appear each evening on TV sets in their homes. And many print journalists for years resented operating in the relative anonymity of newspaper work while their TV counterparts became mini-celebrities in their communities.

By the mid-1970s, the public’s fascination with the Watergate scandal – combined with the improved quality of TV journalism – helped local news departments realize profits. In an effort to retain high ratings, stations began hiring consultants, who advised news directors to invest in one of the national packaged formats, such as “Action News” or “Eyewitness News.” Traveling the country, viewers might notice similar theme music and opening visuals from market to market. Consultants – called “news doctors” – also suggested that stations lead their newscasts with crime blocks: a group of stories that recount the worst local and national crimes of the day. A cynical slogan soon developed in the industry: “If it bleeds, it leads.” Even today, most regional news stations around the country lead newscasts with local isolated crime stories, even though such stories have very little significance for most viewers.

A few stations, however, responded to viewers and critics who complained about the overemphasis on crime, especially since FBI statistics revealed that crime rates fell in most major urban areas during the 1990s. For example, in 1996 the news director at KVUE-TV in Austin, Texas launched a new set of criteria that had to be met for news reports to qualify as responsible crime stories. She asked that her reporters answer the following questions: Do citizens or officials need to take action? Is there an immediate threat to safety? Is there a threat to children? Does the crime have significant community impact? Does the story lend itself to a crime-prevention effort? With KVUE’s new standards, the station eliminated many knee-jerk crime stories. Instead, the station provided a context for understanding crime rather than a mechanical running tally of what crimes were being committed each day (see Holley, 1996).

In addition to news consultants pushing dramatic crime stories, another strategy they favor to counter the grimness of crime coverage is “happy talk”: the seemingly ad-libbed but usually scripted banter that goes on among local news anchors, reporters, meteorologists, and sports reporters before and after news reports. During the 1970s, consultants often recommended such chatter to create a more relaxed feeling on the news set and to foster the illusion of conversational intimacy with viewers. Some news doctors also believed at the time that happy talk was indeed an antidote

to that era's "bad news," which included coverage of urban riots and the Vietnam War. A strategy still used in local news today, happy talk often appears forced and may create awkward transitions, especially when anchors must report on tragic events. Although the situation has improved slightly at some local news stations, national news consultants, such as Frank Magid Associates, continue to set the agenda for what local reporters should cover – lots of local crime – as well as how they should look: young, attractive, pleasant, with little regional accent. Essentially, news doctors have tried to replicate in modern local TV news the ad images of young attractive models that have dominated television advertising since the 1960s, to create continuity between the look of news and the look of the advertising that the news interrupts.

In the new partisan era, "happy talk" has been downgraded. Today the kind of unscripted banter in cable news and the online blogosphere is far less happy – part of a culture of complaint in which pundit hosts and their roundtable of journalists, experts, and friends tend to belittle everything from the government to the other political party to one another. But the key value of the new "partisan chatter" – in addition to appealing to the targeted audience – is its relative cheap costs. Unscripted cable news programs invest little in international or domestic bureaus or investigative projects that require reporters go to the scene, interview key players, and document what is actually happening. This business strategy is much like reality TV programming, which now dominates the television landscape, spurning professional actors and writers for amateurs and loose or unscripted narratives.

Visual Language, Critical Limits, and Fake News

The complexity of the shift from a print-dominated culture to a televisual culture of news is often reduced to a two-dimensional debate about information versus entertainment. However, such criticisms overlook the visual language of TV news and the ways in which images may capture events more powerfully than words. Over the past 60-plus years, TV news has dramatized the United States' key events and provided a clearinghouse for shared information. For example, it is widely acknowledged that the civil rights movement benefited enormously from televised pictures that documented the plight of Southern blacks in the 1960s. Other enduring TV images are embedded in collective memory: the Kennedy and King assassinations in the 1960s; the turmoil of Watergate in the 1970s; the space shuttle disaster and the Chinese student uprisings in the 1980s; the first war on Iraq, the bombing of the Oklahoma City federal building, and the Clinton impeachment hearings in the 1990s; 9/11 and a second war on Iraq that began in 2003; and the 2011 uprisings by Arab citizens against dictatorships in Tunisia, Egypt, Libya, Bahrain, and Yemen among other Middle Eastern countries. During these critical events, national TV news serves as a cultural and social reference point.

But while it is important to acknowledge the crucial historical role that television news has played since its inception, it is likewise critical to understand the subtle ways visual language operates. For example, the mid- to late 1980s saw the rise of a disturbing TV news strategy designed for dramatic effect. In their coverage of crack cocaine, news operations formulated a visual shot in which news photographers (using shaky, handheld cameras) leaped from the back of police vans and followed gun-wielding authorities as they broke down the doors of crack houses. In this type of shot, TV news actually represented the police or state point of view. A profession that prides itself on neutrality and on watching over the police on society's behalf apparently did not question whether it was appropriate for reporters to implicitly tell these stories from the authority's viewpoint (see Reeves & Campbell, 1994).

In assessing the visual power of TV news, images do not stand as a kind of testimony to "reality" that is somehow more authentic than the printed word. Just as there is a construction and selection process in print, images in TV news are also constructed, camera angles are selected, and other images and angles remain invisible. For example, in one ritual shot designed to establish credibility – called a "stand-up" – a TV producer might situate a reporter in front of a courthouse or the White House, when in fact the reporter never entered the courthouse or the White House on that particular day. The pictures make it look like the reporter was at the scene and on top of the situation – and physically present at a newsworthy location – serving as eyewitness to the world.

In the new partisan era, astute critiques of TV and cable news can be found on Comedy Central's *The Daily Show*, anchored by Jon Stewart. The program nightly parodies that formulaic "stand-up" by digitally superimposing a cast of fake reporters in front of exotic foreign locales, Washington, DC, or other US locations. The program also parodies the objective ideal and the "both sides of story" ritual. In a 2004 exchange with "political correspondent" Rob Corddry, Stewart asked him for his opinion about presidential campaign tactics. "My opinion? I don't have opinions," Corddry answered. "I'm a reporter, Jon. My job is to spend half the time repeating what one side says, and half the time repeating the other. Little thing called objectivity; might want to look it up" (quoted in Albanese & Stewart, 2004).

As news court jester, Stewart exposes the melodrama of TV news and cable punditry that nightly depicts the world in various stages of disorder yet overseen by the stalwart, comforting presence of celebrity anchors and pundit hosts from their in-studio, high-tech command centers. As a satirist, Stewart is not so reassuring, arguing that things are a mess and in need of repair. For example, while a national news operation like MSNBC thought nothing of adopting the Pentagon slogan "Operation Iraqi Freedom" in 2003 as its own graphic title, *The Daily Show* countered with "Mess O' Potamia." Even as a fake anchor, Stewart displays a much greater range of emotion than we get from detached modern anchors: more amazement, irony, outrage, and skepticism. In fact, Stewart's emotional range is much more akin to the emotional heat of cable pundits and disgruntled bloggers. Stewart after all is courting

a niche audience of mostly young disaffected viewers who trust neither traditional news nor cable punditry.

Much of what “fake” news shows critique has to do with the way news producers repeat stale familiar formulas rather than invent dynamic new story forms. Although the world has changed, local TV news story formulas have gone virtually unaltered since the 1970s, when *Saturday Night Live*’s “Weekend Update” on NBC first started satirizing TV news. Modern newscasts still limit reporters’ stories to two minutes or less and promote stylish male–female anchor teams, a sports “guy,” and a certified meteorologist as familiar personalities, usually leading with a dramatic local crime story and teasing viewers to stay tuned for a possible weather disaster.

60 Minutes and the Reporter as Star

Although local news rituals have had an impact in changing the face of regional journalism, the most influential journalistic enterprise at the national level has been *60 Minutes* (see Campbell, 1991). In the over 50-year history of television, *60 Minutes* – with its signature detective narrative – remains the only program rated No. 1 in three different decades. It is the most popular and profitable TV program in prime-time history, finishing among the Nielsen top 10 for 24 consecutive years – another record. During the 2010–2011 TV season, *60 Minutes* consistently remained a top-20 program in the ratings. From the mid-1970s to the 2000s, a typical episode of *60 Minutes* reached a bigger audience than any other single news form in US journalism. The program set the standard for investigative TV reporting and dramatic news narratives that few of the many copycat magazine shows have approached. Just as the presentation and narratives of local TV news have not changed much since the 1960s, *60 Minutes* and the prime-time TV news magazine were probably the last major innovations in traditional network news. But while it remains high in the ratings, its own formulaic stories have grown old along with its audience.

Over the years, critics have tried to explain *60 Minutes*’ standing as the United States’ first popular news program. In 1981, the program’s creator, Don Hewitt, told the *Chicago Tribune* that storytelling was the key to the program’s appeal (“Father of *60 Minutes*,” 1981). Hewitt rightly predicted that personal journalism, starring reporters in mini-news dramas, would dislodge hour-long news documentaries in which the network point of view – what Hewitt (1985) calls “the voice of the corporation” (p. 29) – seemed tedious, institutional, and aloof. As the precursor to the personal style of today’s cable pundits and Internet bloggers, Hewitt elevated reporters, including Mike Wallace, Morley Safer, Dan Rather, Ed Bradley, Diane Sawyer, and Leslie Stahl, to star status – a place formerly held only by news anchors, not by interchangeable reporters.

Hewitt’s program was able to downplay that *60 Minutes* is a corporate extension of CBS News (until the fateful 1995 spiked tobacco story – the subject of the Hollywood movie *The Insider*). Instead, it played up the role of reporters as champi-

ons of the little guy and solid Middle American values – another role that cable hosts have taken on in the new partisan era. But instead of identifying with left or right, Hewitt positioned his show and its reporters in the moderate middle – a better economic strategy in the days of the mass audience that *60 Minutes* commanded. Along with the appeal to moderate politics and Middle America, Hewitt adapted a fictional story form – the detective mystery – to TV journalism. Through this familiar cultural frame, the reporters of *60 Minutes* have performed over the years, not as detached journalists but as dramatic characters. Their mission: to locate themselves in the middle of an adventure and make sense of the world through their stories. In foregrounding the dramatic story, *60 Minutes* further weakened the old “information” model. The program’s reporters were viewed not as neutral conduits of information but as major characters in the news with a stake in the outcome, much the way cable news hosts and popular Internet bloggers have positioned themselves as players in the cultural and political landscape.

Even the production techniques on the program contributed to the image of the reporters as detective heroes (Campbell, 1991). First, unlike the conventional evening news, *60 Minutes*’ correspondents are featured characters in their dramas. They are usually in more shots than any of the subjects interviewed. Second, the program’s star reporters typically receive more visual space: they are almost always shown at a greater distance than the characters they interview. Frequently, in reaction shots, interview subjects appear in extreme close-ups – usually with the top of the head cut from the frame. This is in contrast to the medium shots of the reporter, usually shown from mid-waist with space revealed overhead. The greater space granted to the reporters can read on one level as the TV counterpart to print’s neutral third-person point of view. But on another level, the greater distance endows the show’s reporters with more authority. *60 Minutes*’ reporters always appear in greater control, whereas other people who appear on the program often seem to be in less control, or out of control. It is the medium shot that locates the program’s reporters “in the middle most of the time,” playing “both sides of the street.” In other words, at the height of the program’s popularity, the moderate political voices found on *60 Minutes* served the network’s economic interests in cultivating a mass-market audience. In contrast, today’s *partisan* voices serve the interests of cable news operations in targeting niche viewers in a fragmented market.

Given that *60 Minutes* developed over the years as the premier investigative arm of US journalism, it was a surprise in late 1995 when the show decided not to air an episode on the tobacco industry spiking nicotine levels after legal threats from one cigarette company’s lawyers. In fact, this icon of investigative journalism caved into Big Tobacco at a time when CBS was being sold to Westinghouse, and apparently the corporate bosses – and the program’s own journalists with investment ties to the transaction – did not want to hamper the deal. So they waited for the *Wall Street Journal* to break the story and then aired the episode two months later. However, Disney – which owns ABC and the copycat TV news magazine *20/20* – then made a movie about the spiked story (*The Insider*, Michael Mann, 1999).

In the end, stories about the inner economic and political workings of complex institutions – including CBS/Viacom – are not well suited for *60 Minutes*. And, in fact, this can be said for most journalism: there are few good story forms for explaining how institutions work or do not work. Instead, the detective narratives of *60 Minutes* often transformed experience into melodrama, making the world simpler and more understandable. Like Westerns and cop shows, *60 Minutes* has usually championed rugged individualism. In its wake, the cable pundits and digital bloggers likewise are champions of rugged individualism and avowed opponents of government institutions. Detective stories celebrate individual heroes and condemn institutional villains. In this way, journalism in general suffers from this malady that plagues *60 Minutes*, even as significant as some of its best investigative pieces have been: stories centering on the afflictions of individuals make the world seem like a place where problems are personal not social, requiring only private redress or remedy rather than any sort of collective action.

Contemporary Journalism in the Corporate Era

The full-blown arrival of the new partisan era in journalism history was preceded by the corporate era. In fact, the *60 Minutes* spiked story incident reveals that by the late 1990s, journalism was in the heyday of its corporate era. Journalism – so central to US democracy that it is the only business enterprise the founders protected in the Constitution – spent the first part of the nineteenth century freeing itself from political partisanship, only to find itself near the end of the twentieth century under the strong influences of corporate machinations. And the very process that US citizens count on to report on this phenomenon became quiet. It is not in the interest of national or global corporate powers to have their journalism extensions reporting the details of their bosses' business. After all, these kinds of complex "big money" stories – which US viewers actually are interested in – do not fit neatly into formula stories that focus narrowly on the lives of individuals (albeit sometimes individuals wronged at the hands of dysfunctional institutions). How do journalists tell stories about complex institutional problems when many of these powerful institutions are their own corporate parents?

Although corporate control is strong on the newspaper side of the journalism business (Gannett operates the largest newspaper chain in the world, controlling more than 90 daily newspapers), the real impact of the current corporate incarnation is in television. Here journalism outlets throughout the 1980s and 1990s became minor subsidiary companies in large entertainment conglomerates that now own movie studios as well as journalism businesses. Disney, in addition to its theme parks and film division, owns *ABC News*; Viacom, which owns Paramount studios, remains the majority stockholder over *CBS News*; General Electric (and now Comcast, the majority stockholder), which has run *NBC News*, purchased Universal Studios in 2003;

News Corporation owns Fox News in addition to Twentieth Century Fox studios; and Time Warner, which operates CNN, owns Warner Brothers studios among its many other holdings as the world's largest media corporation.

US journalism, of course, has always borne the marks of social schizophrenia, trying to balance its role as public servant to democracy – a watchdog on power and corruption – and its role as profit-making business. But in journalism's corporate phase this balance tipped far too much in favor of narrow business interests and greedy profiteering (see O'Shea, 2011). Both print and TV journalism outlets put far less money into investigative units and, over the years, have done very little business reporting on media ownership issues.

The "big media" corporate era began its slide, first of all, with the loss of newspapers' local monopolies over classified advertising, which had sustained newspaper families and chains like Gannett for decades. On top of that, readers started going elsewhere for the news – to 24/7 cable channels like CNN, which often rendered obsolete much of the national and international news in the morning paper. However, the bigger problem suffered by media corporations, where bigger once seemed better, came from not recognizing quickly enough that the marketplace was fragmenting and the new innovative players – like Craigslist, eBay, The Huffington Post, Drudge Report, Politico, Google, Facebook, and Twitter – would be more nimble, with smaller startup costs, appealing first to niche audiences and not the mass market. Many of these sites saw that what was needed in a new media climate overloaded with information was not necessarily more content but a way to organize the online terrain and guide customers through the content maze, aggregating popular information and the best stories.

The Waning of the Corporate Era

Newspapers were overwhelmed by two changes that collided with the 2008–2009 economic recession. First, new generations of readers grew up not on their local paper's comic strips and sports sections but on cable TV and the Internet. By 2009, more than 65% of the population over age 65 reported reading a newspaper the previous day, compared to less than 30% of young people between 18 and 35. Second, the advertising climate cooled. Newspapers lost their strong grip on classified ads with the emergence of mostly free websites like Craigslist and eBay. Revenue from such ads peaked in 2000, with newspapers earning a total of \$19 billion from classifieds ads. By 2009 newspapers earned only \$6 billion from their classified advertising sections. The economic recession and housing crisis from 2008 to 2010 had substantially limited traditional retail ads, especially from department stores, realtors, and car dealers. Newspaper advertising overall spiked in 2005 at \$49 billion in earnings, but by 2009 that figure was cut almost in half to just \$27.6 billion (Newspaper Association of America, quoted in Parr, 2010). With fewer

advertisers, newspapers laid off workers, shrank their size, changed formats, or declared bankruptcy.

On top of advertising problems, many newspaper owners like the Tribune Company, which declared bankruptcy in 2008, had become *overleveraged*. That is, many media conglomerates borrowed lots of money in the 1990s to buy more media companies and newspapers to expand their businesses and profits. They used some of the borrowed money to fund these purchases and some they invested. Then they used the interest from their investments, plus profits from ad revenue, to pay their bank and loan debt. But when advertising tanked and their investments began losing money in fall 2008 (as the stock market crashed), many big media companies became incapable of paying their debts. To raise capital, reorganize their debt, and avoid bankruptcy, media companies had to lay off reporters and sell valuable assets.

Around 2005, consolidation in newspaper ownership leveled off. The decline in newspaper circulation and ad sales panicked investors, leading to drops in the stock value of newspapers. Many newspaper chains responded by significantly reducing their newsroom staffs. According to Pew's State of the News Media report (Pew Project for Excellence in Journalism, 2010a), about "13,500 jobs for full-time, newsroom professionals" have disappeared since 2007, "the total falling from 55,000 to 41,500. [...] That means that newsrooms have shrunk by 25 percent in three years. [...] To put it another way, newspapers headed into 2010, devoting \$1.6 billion less annually to news than they did three years earlier."

The case of the *Los Angeles Times* (owned by the Tribune Company) demonstrates well the impact of cost-cutting measures on even the most prominent national papers. Continuing demands from the corporate offices for cost reductions led to the resignation of editor John Carroll in 2005. In 2006, another editor and publisher resigned to protest demands for further cuts. More cuts in 2007 resulted in the departures of some of the most talented staff members, including six Pulitzer Prize winners. In 2007, Chicago real estate developer Sam Zell bought the Tribune Company for \$8 billion and made it private, insulating it for a time from market demands for high profit margins. However, by 2008 the company faced declining ad revenue and a tough economy and was forced to file for bankruptcy protection. While the Tribune Company continues to operate its newspapers, its recent history illustrates the enormous economic troubles even very good and very large papers face (see O'Shea, 2011).

About the same time, large newspaper chains started to break up, selling individual newspapers to private equity firms and big banks (like Bank of America and JPMorgan Chase) that deal in distressed and overleveraged companies with too much debt. For example, in 2006, Knight Ridder – then the nation's second leading chain – was sold for \$4.5 billion to the McClatchy Company. McClatchy then broke up the chain by selling off 12 of the 32 papers, including the *San Jose Mercury News* and *Philadelphia Newspapers* (which owns the *Philadelphia Enquirer*). McClatchy also sold its leading newspaper, the *Minneapolis Star Tribune*, for \$530 million, less

than half of what it paid for it eight years earlier. By 2010 private equity companies owned the *Star Tribune* and the *San Diego Union Tribune* and sought control of Philadelphia Newspapers and the Tribune Company, which was still in bankruptcy restructuring in 2011.

Ownership of one of the nation's three national newspapers also changed hands. In 2007 the *Wall Street Journal*, held by the Bancroft family for more than one hundred years, accepted a bid of nearly \$5.8 billion dollars from News Corporation head Rupert Murdoch. At the time, critics raised concerns about takeovers of newspapers by large entertainment conglomerates. As small subsidiaries in large media empires, newspapers have been increasingly treated as just another product line expected to perform in the same way that a movie or TV program does.

By 2008, a number of concerned journalists, economists, and citizens began calling for new business models that would help protect newspapers in the transition to the digital era and keep newspapers out of the hands of private equity companies that usually had more interest in turning a profit than supporting journalism. One possibility is nonprofit ownership. For example, the Poynter Institute owns and operates the *St. Petersburg Times*, Florida's largest newspaper. As a nonprofit, the *St. Petersburg Times* has been protected (at least before 2008) from the unrealistic 16 to 20% profit margins that publicly held newspapers earned pre-mid-2000s. National Public Radio (NPR) represents another nonprofit model, where funding is provided by government subsidies and private contributions. Another possibility for nonprofit ownership is for wealthy universities like Harvard and Yale to purchase and support newspapers, better insulating their public service and watchdog operations from the expectations of the marketplace. Finally, as an alternative to private equity companies, wealthy Internet companies like Microsoft and Google could expand into the news business, buy existing media outlets, and produce content for both online and print papers. In fact, Yahoo! in 2010 began hiring reporters to increase the presence of its online news site. The company hired reporters from politico.com, *BusinessWeek*, the *New York Observer*, the *Washington Post*, and *Talking Points Memo*, among others. Aggregators like Google and Yahoo!, unlike private equity firms, have more of an interest in delivering customers to the best information and stories – that is, the kind of content that attracts advertisers.

Academic journalism departments have responded to the crisis in the newspaper industry by providing valuable assessments of the problem and proposing reforms. One such response was initiated by the dean of Columbia University's Journalism School, who commissioned a study from Leonard Downie, former executive editor of the *Washington Post*, and Michael Schudson, Columbia journalism professor and media scholar. Their 2009 report, "The Reconstruction of American Journalism," focused on the lost circulation, advertising revenue, and news jobs. The report aimed to create a strategy for local reporting that would hold public and government officials accountable, envisioning ways to provide basic access to the kinds of information that citizens need to be well informed. Their recommendations, some of which are underway, were as follows:

- News organizations “substantially devoted to reporting on public affairs” should be allowed to operate as nonprofit entities in order to take in tax-deductible contributions while still collecting ad and subscription revenues.
- Philanthropic organizations and foundations should “substantially increase their support for news organizations” that have shown a commitment to public affairs news and the kind of reporting that holds local leaders, politicians, officials, and government agencies accountable.
- Public radio and TV, through federal reforms in the Corporation for Public Broadcasting (CPB), should reorient their focus to “significant local news reporting in every community served by public stations and their Web sites.”
- Operating their own news services or supporting regional news organizations, public and private universities “should become on-going sources of local, state, specialized subject and accountability news reporting as part of their educational mission.”
- A national Fund for Local News should be established with money that the Federal Communication Commission (FCC) collects from “telecom users, television and radio broadcast licensees, or Internet service providers.”
- News services, nonprofit organizations, and government agencies should use the Internet to “increase the accessibility and usefulness of public information collected by federal, state, and local governments.”

While these recommendations offer promise, they are striking in how reliant they are on nonprofit and public solutions. For-profit mainstream news media remain reluctant to embrace public solutions given their long-standing belief that taking government or other institutional support diminishes their independence. While NPR in particular remains a solid example of a nonprofit news service that offers national and regional coverage, many critics worry about local coverage. In fact, even the major foundations prefer the big spotlight of giving money to more visible national and international news initiatives rather than small local and regional ones. Still, with the loss of so many traditional reporters in the early 2000s, the situation is dire enough that at the very least public and private partnerships offer some hope in ensuring that local reporting and accountability coverage remain central to regional news services.

The Decline of Public Journalism and the Rise of Citizen Reporters

In the wake of the widespread popularity TV news, a number of regional newspapers – starting in the late 1980s – experimented with ways to “fix” print journalism and to more actively involve readers in the news process. In part, editors tried to counter television’s intimacy, with viewers commonly referring to anchors by their first

names but hardly knowing print's anonymous reporters. Experiments surfaced primarily at midsize daily papers, including the *Charlotte Observer*, the *Wichita Eagle*, and the *Virginian-Pilot*. Davis "Buzz" Merritt (1995), former editor and vice president of the *Wichita Eagle*, defined key aspects of civic or public journalism:

- It moves beyond the limited mission of "telling the news" to a broader mission of helping public life go well, and acts out that imperative.
- It moves from detachment to being a fair-minded participant in public life.
- It moves beyond only describing what is "going wrong" to also imagining what "going right" would be like.
- It moves from seeing people as consumers [...] to seeing them as a public, as potential actors in arriving at democratic solutions to public problems (pp. 113–114).

Modern print journalism has always drawn a distinct line between reporter detachment and community involvement. However, public journalism – driven by citizen forums, community conversations, and even talk shows – tried to redraw this line. The impetus behind public journalism was the realization that many citizens felt alienated from participating in public life in a meaningful way. This alienation arose, in part, from watching passively as the political process played out in the news media. The process today stars the politicians who run for office, the "spin doctors" who manage the campaigns, the reporters who dig into dark corners of people's personal lives, and now loud partisan cable and blogging pundits, while readers and viewers serve as mere spectators.

The public journalism movement drew both criticism and praise. Though not a substitute for investigative reporting or the routine coverage of important daily events, public journalism offered a way to involve both the public and journalists more centrally in civic and political life. Editors and reporters interested in addressing citizen alienation (and reporter cynicism) began devising ways to engage people as conversational partners in determining the content of the news. In an effort to draw the public into discussions about community priorities, these journalists began sponsoring reader and citizen forums, where readers were supposed to have a voice in shaping aspects of the news that directly affected them.

Although isolated citizen projects and reader forums are sprinkled throughout the history of journalism, the more recent public journalism movement began in earnest in the late 1980s. One such project began in Wichita, Kansas, after the 1988 elections. Davis Merritt was so discouraged by the paper's typical and conventional political coverage that he led a campaign to use public journalism as a catalyst for reinventing political news. The *Eagle's* first voter project during the 1990 campaign for governor used reader surveys and public forums to refocus the paper around a citizens' agenda. This involved dropping the tired horse-race frame that usually frames political coverage. Merritt believed that a new direction for journalism must "reengage citizens in public life" through two steps: "add to the definition of our job the additional objective of helping public life go well, and then develop the journalistic tools and reflexes

necessary to reach that objective” (Merritt & Rosen, 1998, p. 44). The *Eagle*’s project partially revitalized regional politics in Kansas in the early 1990s.

By the late 1990s, more than a hundred newspapers, many teamed with local television and public radio stations, practiced a form of public journalism. Yet many critics remained skeptical of the experiment (see Cohn, 1995). First, they were concerned that public journalism projects could undermine journalists’ long-standing role as neutral watchdogs and instead pander to what readers – and marketing executives – wanted, thereby reassigning editorial control from newsrooms to business interests. Second, some journalists feared that as they become more active in the community they would be perceived as community boosters rather than as community watchdogs, compromising their ability to report on the wrongdoings of civic organizations. Third, critics worried that public journalism compromised the profession’s credibility, arguing that public journalism turned reporters into participants rather than detached observers. (Of course, as Merritt pointed out, modern journalism had already lost a great deal of credibility with the public – a view supported by polling data.) Fourth, critics contended that public journalism undermined the telling-both-sides-of-a-story convention of journalism by constantly seeking common ground and community consensus. Public journalists countered that they were trying to set aside more room for centrist positions. Such middle positions are representative of many viewpoints in a community but are often missing in the mainstream news, which is traditionally more interested in the extremist views that make for conflict-ridden, two-sided dramatic stories.

In the end, public journalism did not foresee or address the changing economic structure of the news business. With more newspapers (and broadcast stations) in the hands of fewer owners, both public journalists and traditional reporters should have been raising tough questions about the disappearance of competing daily papers and the large profit margins generated by regional monopoly newspapers. Facing little competition, newspapers in the early 2000s continued the trend of cutting reporting staffs and expensive investigative projects and reducing the space for news. Such a trend increased profits and satisfied stockholders for a while, but it also limited community voices and views. Then when the economic crisis hit in 2008, accompanied by major losses in retail and classified advertising and multiple bankruptcies, the newspaper business had a full-blown disaster on its hands.

In retrospect, it is helpful to look at public journalism’s inability to adequately respond to economic shifts in journalism. Particularly troubling was the rise in the number of journalism outlets that became cogs or subsidiaries in large multinational conglomerates, many of which earned the bulk of their money from media hardware and/or entertainment software (Sony, GE, Comcast, Disney, Viacom, Time Warner, News Corp.). Still, the public journalism movement served as a worthy critic of fundamental news values – like reportorial detachment – that have so powerfully shaped the practice and culture of US journalism.

The latest incarnation of public journalism is known as “citizen journalism.” The biggest distinction between them is that, where the former was driven by profession-

als, the latter is driven by amateurs. The combination of the online news experiments and traditional newsroom cutbacks has spurred a grassroots movement in which activist amateurs and concerned citizens – not professional journalists – use the Internet and blogs to both cover events and disseminate information. In fact, with such steep declines in newsroom staffs, many professional media organizations – like CNN (iReport) and many regional newspapers – are increasingly trying to corral citizen journalists as an inexpensive way to make up for journalists lost to newsroom “downsizing.” Journalism students and programs around the country now partner with newspapers to produce reports, especially for online news consumption. Traditional newsrooms today face the very real paradox of being asked by publishers and owners to cut staff at the same time they are being asked to produce more online content.

Some news critics and journalism teachers, like New York University’s Jay Rosen, envision citizen journalism as a new era. Rosen (2006) calls this public citizenry “the people formerly known as the audience.” They now have their own printing presses (and online radio stations and TV stations) and share in the creation of news. Others, like Columbia journalism school dean Nicholas Lemann (2006), see citizen journalism as a possibility, but only with the hard work of reporting to create a foundation for all the opinion that is out there in cyberspace and 24/7 cable: “Reporting [...] is a powerful social tool, because it provides citizens with an independent source of information about the state and other holders of power. It sounds obvious, but reporting requires reporters. They don’t have to be priests or gatekeepers or even paid professionals; they just have to go out and do the work.”

By 2008, a study by J-Lab (the Institute for Interactive Journalism) reported that more than one thousand community-based websites were in operation, posting citizen stories on local government, police, and city development. This represented twice the number of community sites from a year earlier. J-Lab also operates the Knight Citizen News Network, “a Web site that advises citizens and traditional journalists on how to launch and operate community news and information sites” (Deagon, 2008). In 2009, “a multi-university team of academics” examined “60 of the most highly regarded citizen sites identified by nationally known experts in new media” (Pew Project for Excellence in Journalism, 2010b). While the study found that “a number of these sites individually revealed some impressive work,” the funding and “resources to provide these services at the same level of full news operations, day-in and day-out, do not exist, at least as of now” (Pew Project for Excellence in Journalism, 2010b). The report also found “fairly limited levels of new content,” many sites that were not very transparent about funding and daily operations, and policies were “no more likely to encourage citizen postings” than traditional commercial news media sites” (Pew Project for Excellence in Journalism, 2010b). The bottom line: in 2010, citizen journalism sites – many started by disaffected print reporters in league with ordinary citizens and amateur journalists – did not yet have the resources to provide the kind of regional news coverage that local newspapers once provided.

Nevertheless, in these sites Lemann sees the possibilities for new kinds of news narratives on the Internet. “Potentially, it is the best reporting medium ever invented,” he has said.

A few places, like the site on Yahoo! operated by Kevin Sites, consistently offer good journalism that has a distinctly Internet, rather than repurposed, feeling. To keep pushing in that direction, though, requires that we hold up original reporting as a virtue and use the Internet to find new ways of presenting fresh material – which, inescapably, will wind up being produced by people who do that full time, not “citizens” with day jobs. (Lemann, 2006)

Back in 2006, recognizing the “new balance of power” emerging between “big media” and engaged citizens, Jay Rosen (2006) noted that corporate media no longer own the press; instead, it “is now divided into pro and amateur zones.”

New News Narratives and Implications for Journalism Education

So in this world where there are fewer professionals and more amateurs, where newsroom staffs decline at the moment when more online content is needed, how does journalism education adjust? What do we teach our students about living and working in a new partisan era, where punditry trumps expertise? What are the possibilities for new and better forms of news? In the face of all the unverified rhetoric and partisan opinion, journalism needs to imagine new ways to tell both individual *and* institutional stories – to invent story forms that are as complex and compelling as the times we live in.

In *The Elements of Journalism*, Kovach and Rosenstiel (2007) argue that “the primary purpose of journalism is to provide citizens with the information they need to be free and self-governing” (p. 13). Today, this guiding principle has been derailed. First, with the Internet and 24/7 news services, there is much more undocumented opinion masquerading as news, pushing aside credible information. In a world engulfed in so many media outlets, journalists and the pundit enterprises may be producing too much decontextualized information and too many insignificant stories. According to social critic Neil Postman (1995), by the mid-1990s society had developed an “information glut” as a result of developments in media technology, transforming news and information into “a form of garbage” (p. 35). Postman believed that scientists, technicians, managers, and journalists had piled up mountains of new data, which added to the problems of everyday life. As a result, too much unchecked data, too little thoughtful discussion, and too few good stories emanated from too many channels of communication. A second, related problem suggests that the amount of information the media now provide has made little impact on improving social and

political life. In fact, many people feel cut off from our major institutions, including journalism. As the citizen journalism movement attests, people are looking for ways to take part in public conversations and civic debates – to renew a democracy in which many voices participate.

Although newspapers and their online sites remain the strongest source for good reporting, critics have raised a number of concerns about their future. For instance, have news stories become so formulaic and brief that they actually discourage new approaches to telling stories and reporting news? Another criticism is that many one-newspaper cities cover only issues and events of interest to middle- and upper-middle-class readers, thereby underreporting the issues that affect working-class and poor citizens. There has also been a downturn in stories that address readers as citizens and members of communities, and an upsurge in information that regards audiences primarily as savvy consumers, private individuals, and focus groups.

Journalists in the nineteenth century gained economic independence by freeing themselves from political party subsidies. That independence was increasingly compromised in the twentieth century as large entertainment corporations, like Disney and News Corporation, bought up mainstream news outlets. But in this new partisan era, where opinion blogging and 24/7 talking heads are much cheaper than maintaining news bureaus and sending reporters out to document what is actually going on in the world, the major threat to journalism may be the triumph of the “journalism of assertion.” For news to move forward in the age of the Internet, with its fragmented audience, publishers and owners need to invest in reporters and substantive reporting – in the “journalism of verification.” Kovach and Rosenstiel (2007) argue that “journalists must make the significant interesting and relevant” (p. 187). Yet too often on cable and the Internet we are awash in “journalism” that tries to *make* something significant out of the obviously trivial, mildly interesting, or narrowly relevant – like stories about troubled celebrities, attention-seeking politicians, or decontextualized stock market numbers.

For those of us who teach journalism and work in journalism, opportunities abound. We can teach students to break free from static older formulas – especially in TV news – and reimagine new ways to tell stories. In fictional TV, for example, storytelling has evolved over time, becoming increasingly dynamic and complex. Comparing the 1970s mega-hit TV show *Dallas* to more recent shows like *The West Wing*, *Alias*, *The Sopranos*, and *24*, Stephen Johnson (2005) argued that “one of the most complex social networks on popular television in the seventies looks practically infantile next to the social networks of today’s hit dramas” (p. 115). So if fictional storytelling has evolved, why has TV news remained entrenched in old formulas and time constraints that are virtually unchanged over the past 40 years? Why has *60 Minutes*’ 45-year-old detective formula for news magazines remained the standard for doing long-form TV news? Aren’t there other ways to tell stories? It is no wonder young people are looking to *The Daily Show*, blog sites, citizen journalism, and social network venues for news and information. Perhaps they want something to match the more complicated storytelling around them, in everything from TV dramas to

interactive videogames to their own conversations. The world has grown more complicated and we as citizens should demand significant news stories that better represent that complexity than formulaic 1:30-minute TV news packages sketching stories of little consequence.

One key narrative strategy that journalism students should learn is how to move from the individual to the social in their stories – from the merely interesting to the truly significant, from a small illustration to the big picture. It isn't enough to just tell the story of an out-of-work father or a struggling family living in a cheap hotel after losing their home to foreclosure. The individual characters in these kinds of stories can serve the narrative as a way into a more ambitious story. They are the "hook" that allows reader and viewers to identify, as individuals, with other individuals. But they are also catalysts for moving the story to the social level, presenting broad data on joblessness or on foreclosures and using experts to document local and national trends. These kinds of complex narratives are now easier to do since online journalism has solved the space constraints of print news and time limits of broadcast news. Journalism students need to learn how to tell more complicated stories, ones that provide context and more adequately address substantive social issues in which larger audiences have a stake. This type of complicated storytelling also serves readers by not implying that individuals in news stories are the sole agents for fixing their circumstances. Joblessness and foreclosures are not just a personal crisis for an individual or one family but social problems whose solutions require collective action.

Another important strategy for championing better journalism – a "journalism of verification" that covers stories of real social significance – is to encourage commercial–nonprofit partnerships between newsrooms and universities, as Downie and Schudson (2009) have advocated. This is what some call a "pro-am" model: a partnership between professional newsrooms and amateur students. Journalism students should no longer be writing just for their teachers; in an online world hungry for content, they should be writing for newsrooms and covering their communities. The Poynter Institute offers several strategies for successful news organization and university partnerships. For example, the journalism school at NYU has partnered with the *New York Times* to cover "hyperlocal" news for the East Village in Manhattan. The faculty member in charge, an ex-*Times* reporter, works with a *Times* metro editor to edit and ensure the quality of the students' work. In a second example, the *Bay Citizen* has partnered with the UC-Berkeley business and journalism schools "to develop a 'test kitchen' for innovation and experimentation in journalism" (Jean, 2010).

At Miami University in Oxford, Ohio, the small liberal arts-based journalism program has partnered with the media giant Cox Communication and its southwest Ohio operation, which includes four dailies, four weeklies, and commercial radio and TV stations in Dayton. The partnership has a long-range plan to relocate the editor of the local weekly paper, the *Oxford Press*, to a campus office near the journalism faculty and writing/editing labs. There that person will supervise interns (the paper no longer has any full-time reporters) and co-direct with a faculty member a regional news service dedicated to special projects that many newsrooms in the area no longer

have the resources to produce. The students will write news stories either through special classes set up to execute specific Cox projects or through particular assignments arranged with Cox.

Finally, despite the cynics who say a degree in journalism is worthless, students recognize its value. At Miami University, the journalism program is not in a professional school but instead housed in an arts and science college. It also requires a second major. Journalism is considered part of the humanities at Miami, and the Journalism 101 course counts toward a student's general education plan; course instructors teach the history of journalism and its role in democracy, as well as introducing students to basic news reporting and writing skills. The program is also partnering on a data visualization project with statistics and graphic design faculty to help students write better narratives about numbers that require graphs and charts that should tell their own complex stories. The majority of students in the program do not go into journalism, but they like the double major requirement for its breadth; they want a field that will improve their writing and storytelling; they seek internships in news media, public relations, and publishing to see what kind of work they want to do; and they prefer to know something about how the best news media operate. Good journalism requires traits that are found in good scholarship – verification, documentation, and interviewing as foundational for any good story or report. In this new partisan era, overloaded with decontextualized information and undocumented punditry, these skills are more important than ever. The best journalists, like the best scholars, are imaginative and innovative; they match the appropriate story or report to the experience they are trying to verify. They invent new narrative and reporting forms when old formulas are failing. They also continue journalism's democratic traditions: documenting and interpreting the importance of events, keeping watch over our central institutions, and telling a community's significant stories in compelling ways. This is the kind of journalism that will save and sustain the profession, along with the critical role it plays in the democratic process – no matter how bad the economy gets, no matter how fractured the marketplace, and no matter how many newspapers are displaced by online alternatives.

Transformations and Tactics

The Production Culture of the Hong Kong Film Industry

Sylvia J. Martin

ABSTRACT

This chapter examines the production culture of the film industry of Hong Kong after its 1997 return to China. Drawing from anthropological fieldwork, I posit that the production culture cannot be separated from the larger cultural practices and social formations in which it occurs. Three recurring themes within the film community are examined: decline, flexibility, and marginal social status. The reasons for the industry's decline are explicated through an analysis of how flexibility is employed as a tactic by industry members, particularly for Chinese co-productions. I argue that the vaunted flexibility of the film industry is influenced by colonial and post-colonial discourse about entrepreneurship and neoliberalism and has in fact fragmented the collective power of Hong Kong film labor. Finally, I explore the industry's socially marginal status and illustrate the tactics deployed to transform the industry. These three themes illustrate the Hong Kong film industry's changing context within East Asia.

Across the Pacific Ocean from Hollywood, which is sprawled across Los Angeles, lies another film industry that also boasts a century-long history of commercial films and famous movie stars. That film industry – based in Hong Kong – came to be known, to industry insiders and film scholars, as the “Hollywood of the East,” on account of its high output of films, both for domestic and for overseas audiences, and on

account of its profit orientation (Dannen, 1997, p. 1; Fu, 2000, p. 200; Stokes & Hoover, 1999, p. 17). Drawing from anthropological fieldwork, this chapter examines the production culture of the “Hollywood of the East” – the film industry of Hong Kong – after reunification with China, focusing on key characteristics of its decline, its flexibility, and its marginal social status.

Unlike Hollywood, USA, the Hong Kong film industry is not a national film industry. A former colony of Britain, the city-state of Hong Kong is currently a special administrative region (SAR) of China. Following its capture by the British after the Opium Wars between 1839–1860, the colonial government used Hong Kong’s harbor to turn the colony into an *entrepôt* and thus to further British imperial interests in shipping, banking, and trade. Government officials and economists have since declared Hong Kong to be a haven of free-market practices with minimal government interference, even after Hong Kong’s return to mainland Chinese sovereignty in 1997.¹ Hence, for the past century the Hong Kong film industry has existed under a *laissez-faire* capitalism that has helped shape how the film community conducts its work.

The production culture of a media industry consists of the everyday practices and belief systems of media personnel, as its members engage in their work (Caldwell, 2008, p. 1). John Caldwell – himself influenced by interpretive anthropology’s analysis of “symbolic processes” within cultures and communities – calls for examining media production cultures as “social communities in their own right” comprised of diverse work practices and competing hierarchies of power (p. 2). The communities of media personnel based in Hong Kong have developed their own work culture; yet, as I will illustrate here, these immediate dynamics are not separable from geopolitical currents such as postcolonial governance and diaspora.² Anthropological studies of other industries have similarly demonstrated ways in which production processes are not disconnected from broader cultural practices (Freeman, 2000; Kondo, 1990; Ong, 1987; Zaloom, 2005). Ruth Mandel’s (2002) account of how members of the post-socialist Kazakh television personnel in the 1990s alternately embraced and resisted their BBC consultants’ advice as they wrote scripts, developed characters, and designed the set of a Kazakh soap opera is one such example. Set during the transition to a free-market economy, Mandel’s study illustrates that production is indeed what another anthropologist of the media refers to as a “site of meaning-making” for its members (Ganti, 2000, p. 16). For media scholars across disciplines, it is important to see broader sociocultural practices, which shape media and can become articulated in the production process, and the ways in which they do so.

Anthropologists have studied the contexts and the culture of film production since the 1940s. In 1946–1947 Hortense Powdermaker (1951) conducted an ethnographic study of the socioeconomic relations in Hollywood studios. One of Powdermaker’s most valuable contributions was to connect up the practices of studio executives with discussions of democracy and totalitarianism that emerged in the aftermath of World War II. More than half a century later, more anthropological analyses of the socioeconomic relations between producers, actors, and crew on sets and in production

offices have emerged (Dornfeld, 1998; Ganti, 2004; Martin, 2009; Wilkinson-Weber, 2004). To this canon, anthropologists have reflected on the epistemological and methodological challenges of acquiring access to production executives and to creative elites through the process known as “studying up” (Ginsburg, Abu-Lughod, & Larkin, 2002; Nader, 1972; Ortner, 2009).

During my anthropological fieldwork on the Hong Kong film industry, there were three recurring themes that I encountered – and I came across them in interviews; through participant observation of industry insiders as they worked on film sets and in production offices and shared exchanges at meetings; in trade and government materials; and in public discourse. These themes are integral to understanding production culture in Hong Kong over the past decade. The first discursive theme is *decline*: the downturn of the Hong Kong film industry, starting in the 1990s, is a challenge with which the film industry and its members still grapple in multiple ways. The second theme is *flexibility*. Many members of media personnel describe themselves as flexible and engage in flexible worker attitudes and business activities. Yet their narratives show that flexibility is not a neutral quality; it is instead influenced by cultural and ideological discourses about neoliberalism and self-entrepreneurship. The third theme is the *socially marginal status* of those involved in the film industry. While young people from upper-middle-class families overseas flock in to work in the film industry, the industry’s socially marginal status – a historical feature in Hong Kong – shapes its production culture, particularly the ways media workers strive to attain respectability. These discursive notions among members of media personnel – decline, flexibility, and marginal status – describe and drive the Hong Kong film industry and its place in the East Asian region of film production. At times, analysis of these three themes requires shifting the scale between the local, the regional, and the global, which entails a multi-sited ethnographic approach to studying relations and formations across complex capitalist world systems (Marcus, 1995; Strathern, 1995). Cross-media analysis is also valuable, since film/TV industries converge at various points; due to limited space, this chapter will focus primarily on the film industry.³

My discussion of media production in Hong Kong is based on 15 months of fieldwork conducted in Hong Kong over several fieldtrips: June to September 2004; July 2005 to March 2006; and December 2006 to February 2007. I tracked several local interlocutors across the Pacific Rim, observing them at various sites, both in Hollywood and in Hong Kong.⁴ I also interviewed 50 media workers in Hong Kong in structured, semi-structured, and unstructured formats. I conducted participant observation on film/TV sets, I observed interior and exterior filming, I attended production meetings and film screenings, and I assisted in editing English-language scripts. I also engaged in archival research and textual analysis of films and in what Caldwell (2008, p. 3, 5) calls “trade artifacts,” such as “behind-the-scenes” footage not intended for the general public.

I turn now to the first key theme that characterizes the post-1997 Hong Kong film industry, that of decline.

Table 21.1 Decline of Hong Kong film production

Year	Films produced
1990	247
1993	188
1999	94
2002	92
2006	51

Decline

For decades the Hong Kong film industry produced hundreds of films that served not only a local audience, but Chinese diasporic communities. Its highly commercial productivity and its transnational circuit helped the industry earn the title of “Hollywood of the East.” In examining the reasons why the Hong Kong film industry underwent a downturn, we must widen our scope so as to encompass the Pacific Rim – specifically, parts of East Asia and California. The reasons for the decline, particularly in production output, emerged in the 1990s. There are four main causes for this decline: the 1997 return of Hong Kong to China and the subsequent loss of talent; the 1997 Asian Financial Crisis; the increased presence of Hollywood films; and piracy.

The year 1997 was very important for the Hong Kong film industry and its future. The lead-up to the city-state’s return to China sparked nervousness among Hong Kong’s top talent, especially after the Tiananmen Square protests of 1989 in China. The 1997 return resulted in an overseas exodus of Hong Kong film workers seeking jobs, often as members of an elite class of new citizens (Ong, 1999). Many people were uncertain how the new “one country, two systems” form of governance would impact Hong Kong’s liberalized economy, its “democratic” colonial government,⁵ and its political and cultural autonomy (Chow, 1998; So, 2004). The year 1997 was also critical in that it marked the Asian financial crisis. Triggered by the collapse of the Thai currency, a crisis spread throughout the Southeast Asian economies, causing film investors throughout the region to retract financing from possibly risky ventures (Curtin, 2007). Decreased investment was accompanied by smaller audiences for Hong Kong films – a phenomenon that was additional to aggressive Hollywood-film marketing and distribution throughout the 1990s. Finally, the late 1990s saw the intensification of piracy, which hurt the film industry through video cassette disc in particular. While the Hong Kong government subsequently reduced pirate production and distribution in Hong Kong, domestic and Chinese sales of the goods nevertheless hurt the legitimate film industry (Teo, 2008).

When one turns to the response to the film industry's decline, flexibility on the part of the industry and of the Hong Kong Special Administrative Region (HKSAR) government features prominently.

Flexibility

Flexibility – already a prominent element of production processes in Hong Kong (Fore, 1994) – has increasingly come to be understood and expressed as a work tactic for overcoming industrial decline. Flexibility here refers to workers' ability to swiftly adapt to changing media landscapes. This includes avoiding political uncertainty or embracing political shifts, such as Hong Kong's trade agreement with China. Whether workers commute across the border for jobs in Beijing or engage in foreign productions in Hong Kong, their adjustments require new languages, dialects, and increasingly itinerant lifestyles. Thus flexibility is not without risk, as it entails sudden geographic moves, ideological transitions, and new business and social practices. Risk-taking, as I will discuss later, is a component of flexibility and is also espoused by the Hong Kong SAR government for its citizen-subjects.

Media workers frequently proclaimed that flexibility is a quality and a mode of work that is crucial to their careers and to the survival of the industry. Flexibility, after all, is not merely an economic behavior; it has become a cultural attitude, an identity, indeed an ethos to be embraced. As is evident in other industries globally, flexible accumulation in industrial production has fragmented labor markets both geographically and within trades (Harvey, 1990). In many parts of the world, the threat of outsourcing and of casualization meant that workers within a labor segment had to "innovate" in order to perform multiple tasks that were previously outside the scope of their labor roles. Additionally, the term *flexibility* is not without historical and political baggage in the region, given the steady migrations of the Cantonese-speaking population between Hong Kong and southern China.

Yet my research subjects almost always use the term with a positive connotation. They embrace geographic mobility and linguistic versatility as key components of what the film industry defines as *being flexible*. They replicate the entrepreneurial bent for which the Hong Kong film industry has come to be known (Rodriguez, 1999; Stokes & Hoover, 1999). Those who celebrate flexibility often invoke Hong Kong's reputation as a free-trade haven of hard-working entrepreneurs who have embraced the market (Hong Kong Trade Development Council, 2005; Friedman, 2006). These attitudes stem from the British colonial policy of positive non-intervention, which instituted minimal market regulation, low taxation and tariffs, and loose labor laws. During my fieldwork, many members of the Hong Kong film industry attributed the industry's success to the colonial economic policies of *laissez-faire* – and they did so especially now, when they had to contend with vague

and restrictive stipulations imposed by mainland Chinese authorities and ministries. Yet the vaunted flexibility of the film industry and of its members is partly a result of and response to deliberate colonial policies that scourged leftist, anti-colonial elements and promoted the interests of right-wing companies that hinged on laissez-faire economics. It should also be noted that the flexibility celebrated by some is partly a result of a colonial administration that did not foster local industrial development (Castells, 2000; Chiu, Ho, & Lui, 1997; England, 1989). Weak labor laws discouraged unionization, a clear division of labor, and consistent regulation of worker safety, impacting media workers negatively (Rodriguez, 1999; Stokes & Hoover, 1999). Workers lack the solid support of industry associations, such as guilds and unions, to provide networking and educational resources as well as professional identity status.

Flexibility is thus a general characteristic of global film labor and production with its own local and regional characteristics. These characteristics can be witnessed at different levels of scale in Hong Kong film production, encompassing a wide array of media workers, government administrators, and business personnel. These flexible characteristics have resulted in a production culture that touts mobility, adaptability, and multi-tasking labor.

Mobility

“Am working in S’pore for a few days, will call u when back in HK.” This short message service (SMS) message, sent from a Hong Kong actress working in Singapore to my mobile phone in Hong Kong, is a typical example of my communication with Hong Kong media workers. It expresses a geographic mobility in the era of global capital that is constitutive of the flexibility valorized by Hong Kong media personnel. It attests to the increasingly migratory and transborder nature of media production in East Asia, particularly for Hong Kong-based media workers who shuttle throughout Asia – mainland China, Taiwan, Thailand, Japan, South Korea, and Malaysia. A veteran Hong Kong stunt director whom I interviewed commutes regularly between his home in Hong Kong and various productions filming in Beijing. Several members of his stunt team resettled in Beijing, as there was more regular work for them across the border. Local talent must capitalize upon Hong Kong’s transnational reputation as one of the savviest locales in East Asia (Davis & Yeh, 2008, p. 97), while utilizing opportunities and contacts elsewhere in order to keep working. Many Hong Kong film workers, from actors to fight choreographers, work on films across the border in China. Thus they navigate the dual, yet interconnected trajectories of local and transborder productions. Electronic hiring halls, such as alivenotdead.com and the Facebook site Hong Kong Performing Artists, allow transnational visibility and shared access to a variety of jobs in East Asia and reflect the increasingly deterritorialized nature of film production in East Asia.

Mobility necessitates that media workers learn or improve their skills in various languages. It also allows them to draw upon far-flung familial ties. For instance, many Hong Kong media workers make efforts to learn Putonghua (Modern Standard Chinese, or Mandarin), since many job offers are in China, Taiwan, or Singapore. My interviews with a Hong Kong film executive were arranged between sessions with her Putonghua tutor, who schools her in business-oriented language as well as in the vernacular. A Hong Kong Chinese actress whom I spent time with lost a feature-film role in Taiwan because the director did not feel that she had a strong enough grasp of spoken Putonghua. For set decorators and fight choreographers who work across the border in China, some knowledge of Putonghua is helpful, if not essential. English is also considered important for media workers, especially producers and directors, who are increasingly turning towards Anglo-Euro-Americans as investors and distributors. To work with overseas companies, treatments, scripts, and budget line-items need to be accessible in English. Even though directors or cinematographers can rely upon translators, some knowledge of English facilitates relations between Hong Kong Chinese media personnel and the English-speaking crew in US-based productions.

Diasporic Chinese communities around the world are also tapped for the optimization of media career trajectories. Such mobility involves what Aihwa Ong refers to as “flexible citizenship,” in which individuals, “through a variety of familial and economic practices, seek to evade, deflect, and take advantage of political and economic conditions in different parts of the world” (1999, p. 113). Family relations strung across Asia and the Pacific Rim can assist Hong Kong-based media personnel in activating its members’ careers. For instance, a Hong Kong Chinese woman I met joined her husband in the US nearly 20 years ago, when he emigrated from Hong Kong to Minnesota for work. Over time they both became US citizens, but she returned to become a film and television worker in Hong Kong. Using her elderly parents in Hong Kong and her college-age sons in Los Angeles as excuses to travel, the aspiring actress was able to leave her husband for periods of up to six months, accelerating her career on both sides of the Pacific Rim. She managed in the process to utilize her traditionally gendered familial connections and obligations (p. 127) as a flexible springboard in order to launch her own transnational career. National differences and racial dynamics shape mobility beyond the Hong Kong film-production culture. Drawing on the example above, the reception of the actress has been uneven in Hong Kong and in the US. Although her command of spoken English is excellent (she received an anglicized education at an elite school in Hong Kong), her ethnicity and what casters have called her “accent” have limited her opportunities in Hollywood. Thus, while some members of the media personnel have been able to optimize their opportunities by capitalizing on linguistic competencies and on dispersed family relations as well as by acquiring the proper documents for travel (passports and visas), racial discrimination remains entrenched in production cultures. For Hong Kong media workers, this means that there are considerable stakes to produce media in

East Asia – and particularly in China, where their Hong Kong identities are constructed in different ways.

Adaptability

In the post-1997 era, film co-productions between mainland China and Hong Kong have become the emerging standard (Curtin, 2010; Pang, 2010), resulting from the Closer Economic Partnership Arrangement (CEPA) (Davis & Yeh, 2008; Pang, 2007; Teo, 2008). A cross-border free-trade agreement between mainland China and Hong Kong, CEPA promised to raise the Hong Kong film industry out of its depression while liberalizing the mainland film industry and popularizing mainland film beyond the scope of socialist propaganda films and art-house fare (Davis & Yeh, 2009, p. 102). Undoubtedly China also sought to galvanize a “Greater China,” in which it would be united with Hong Kong and Taiwan. Hong Kong expected CEPA to boost the Hong Kong film industry by allowing its filmmakers access to mainland investment and to distribution markets that would expand under the quota exemptions for the co-produced films.⁶ While this formal state–industry alliance between the two polities has multiple ramifications for their political economies, workers on both sides of the border have had to adapt to dual production cultures.

CEPA illustrates the complexity of cultural identities and differences that emerge in a regional film-production culture. Talent from Hong Kong, mainland China, and Taiwan play leading roles in films that construct “Greater China.” CEPA has also served as a conduit for the transfer of technical skills and stylistic knowledge from a commercially mature market, such as Hong Kong, to a newly liberalizing one, such as China. This has required some adaptive learning on both sides of the borders.

CEPA is viewed by many Hong Kong film workers as both helping and hampering their filmmaking careers in ways that reveal perceived cultural differences – some of which emanate from differing political economic histories. The profit potential of China’s vast market beckons to Hong Kong media workers, who see their commercial experience and glamour as enticing Chinese funding sources and audiences. Many Hong Kong film workers consider building fan bases and social networks in China as a tactic to expand and intensify their career options as production within Hong Kong has dried up. Yet the censorship imposed by Chinese authorities for CEPA projects has been decried by Hong Kong media workers as oppressive and inconvenient. Some Hong Kong filmmakers adjust to mainland censorship by staging mystical stories in the mythical past, for instance, or by producing an alternate and politically appropriate ending of a film for mainland Chinese audiences. Many others, such as the numerous directors, producers, and writers I interviewed, complained of constraints on filmmakers’ “freedom of expression” to churn out what has become standard fare.

Hong Kong’s film industry must contend with the complexity that mainland China generates, as it “supplies not only money and market but also a new Chinese identity

and a new global position” (Pang, 2007, p. 419). Many of these pan-Chinese co-productions have been blockbusters, or what is referred to as *dapian* (literally, “big movies”) – such as the historical–martial arts epics. As Stephen Teo (2009) claims, Hong Kong audiences are not really drawn to the *dapian* that Hong Kong producers feel they must co-produce in order to keep the industry and their careers afloat. The relief with which many Hong Kong media personnel members first greeted CEPA shifted to reluctant participation by 2007. Many of them expressed the view that Hong Kong’s fate is tied to that of the mainland, so the film industry and its personnel must adapt to the environment, or it would risk obsolescence. CEPA represents the latest iteration of the encounters and blurred cultural relations between Hong Kong and mainland China that characterize the production culture.

Multi-Tasking Labor

Like actors in Hollywood, Hong Kong actors must be able to display various skills in multiple venues. Actors, or “artists” as they refer to themselves in English, are expected to act and sing across media platforms that include films, commercials, and TV variety shows and, when necessary, to work as models or disc jockeys (DJs). A variety of media personnel may act, produce, write, direct, and sing in various projects.

The lack of a unionized labor force supports flexible multi-tasking. Hong Kong features loose and informal guild-like associations for various segments of media labor. As a result, the film industry lacks some of the formal and organized opportunities for professionalization that many of the Hollywood unions and guilds provide. Professionalization happens on the job.⁷ Labor contracts and legal enforcements tend to be less codified, less pervasive, and less formally applied in the Hong Kong film/TV industries than in Hollywood. As a result, salaries for principal actors and creative personnel in Hong Kong are generally much lower than their counterparts in Hollywood. Hong Kong’s film industry also does not rigidly enforce job segmentation and fixed pay scales. It resembles independent film production in Hollywood: it is not uncommon for a crew member to spontaneously play a role on camera, or for an actor to double as a camera operator. What several Hong Kong filmmakers described as “guerilla filmmaking” resembles Hollywood indie filmmaking, or on-location productions, which film with reduced executive scrutiny and make rather fluid filming arrangements and social relations.⁸

While the budgets and resources of Hollywood productions – that is, their financing, marketing, distribution, and international cachet – are desirable for many Hong Kong media personnel, many people I interviewed and observed dismissed Hollywood unions as inflexible, divisive, and counterproductive. Divisions between tasks are not generally upheld as a way to protect job specialization and longevity, as is commonly found in Hollywood union productions (Martin, 2009). Instead, many media personnel members point to the lack of unions in Hong Kong as the reason why they are

more flexible and therefore more collaborative than Hollywood workers. When the Hollywood writers' guild went on strike in November 2007, in the middle of the production season, many members of Hong Kong media personnel viewed the act as ludicrous and as a luxury permitted by a bloated system. On the basis of their personal experience of working in Hollywood, or just from industry hearsay, they further complained that union media labor was not in the interest of the film being made, since it slowed production and the accrual of quick returns. One of the reasons why so many members of Hong Kong media personnel dismiss Hollywood unions may be that they overlook the fact that such unions provide healthcare: this is a crucial benefit for American media workers, whereas in Hong Kong all residents enjoy universal healthcare.

Filmmaking is generally a more creatively collective and faster paced enterprise in Hong Kong. In some films, people who are formally considered lower in the production hierarchy are welcome to contribute suggestions regarding dialogue or visual imagery in the course of filming. Improvisation is also quite common during filming in Hong Kong. Writers and directors may hurriedly rewrite dialogue and plot details between scenes or during lunch breaks. Action films and other genres that feature live action are also open to changes and modifications on the spot, requiring a collective flexibility in terms of location, personnel and equipment. These fluid work practices are understood as quickening the pace of production. A two-hour feature film may require 40 to 70 shots a day. The "gritty look" that many Hong Kong films are known for is often the result of fewer lights, which require less time, personnel, and money to set up. As a Hong Kong director commented: "In Hong Kong, the crew moves quickly or they won't be hired again." When I observed a Hong Kong filmmaker directing a feature film in Hollywood, he complained about the slow pace of Hollywood union productions, likening the camera crew's and the grips' relaxed and jovial manner of working to a party atmosphere.⁹ Numerous Hong Kong media personnel – from directors to producers to cinematographers to fight choreographers – echoed his view. Other forms of collective action may occur among sectors outside of specific productions (for instance, an annual dinner for stunt workers) or in casual circumstances on the set of film productions. Members of a film production typically eat meals together on set, and few productions can afford trailers for its stars, most actors preferring to mix with the rest of the crew. To many members of Hong Kong media personnel, this mix indicates the "flexibility" in status and socializing that Hollywood union productions lack. In these kinds of interactions there occur friendly exchanges and information about future jobs and business dealings.

Paradoxically, even though many members of Hong Kong media personnel dismiss Hollywood unions as promoting the interests of the individual over those of the film, they are themselves forced to be entrepreneurial, as local-production work dwindles and openings arise overseas. Stunt workers who received limited formal schooling seek English-language instruction later in life in order to maximize their employment options, extending them to jobs with European and Anglo-American production companies. Online language instruction or language exchange programs in English and Putonghua offer free or cheap

ways of increasing these workers' marketability. One Hong Kong producer paid to take a local course with an American agent and Hollywood-film professional, to learn not only how to pitch projects to European and Anglo-American financiers and producers, but also how to do so using English-language Hollywood jargon.¹⁰ Multi-tasking oriented toward acquiring computer skills and using film-production software is also gaining momentum among media personnel such as stunt workers and screenwriters. All of these forms of professionalization are the responsibility of individual media workers and are rarely subsidized or organized by any organization. Thus the mild impatience that some Hong Kong media personnel members harbor toward Hollywood unions may also disguise a small measure of envy for their models of labor organization, support, and cohesion.

Contextualizing Flexibility

It is necessary to read critically the flexible attitudes and practices that are so highly vaunted in Hong Kong's cultural economy as having neither a neutral nor a natural quality through which hard-working people (such as media personnel members) are automatically rewarded. Instead, flexibility signifies a set of practices and attitudes that have fragmented the collective power of media labor against managerial forces, even though these practices also foster an environment of creative collectivity on film sets. The former effect of flexible work practices is well documented in David Harvey's (1990) discussion of postindustrial capitalism in the West. They fit in the scope of the wave of neoliberal policies that helped the wealthiest citizens profit by taking away the social benefits that workers could expect (Harvey, 2005). The latter, however, demonstrates the ways in which Hong Kong's production culture is different from Western production cultures.

For our purposes, it is relevant to point out that the HKSAR government has championed a labor force of workers who have self-enterprising subjectivities – that is, a willingness for risk-taking and attitudes that require flexibility (Ku and Pun, 2004, p. 1; Ong, 2006, p. 173; Rose, 1996, p. 58). As Ku and Pun write, with the uneven integration of Hong Kong and China, the SAR government tries to promote *both* a global city and a Chinese city.

What lies behind the new political project is the construction of a citizen-subject who is required to acquire a specific ethic of self: the enterprising individual. *The enterprising individual is someone who is always on the lookout for resources and new opportunities to enhance their income, power, life chances, and quality of life in order to take advantage of the rapid changes of economy and society [...]* In the words of [Hong Kong's] Chief Executive, the enterprising individual embodies certain personal qualities such as "intelligence, determination, and adaptability." (2004, p. 1, italics added)

The "enterprising individual" who espouses the qualities of flexibility described above is thus a product of government policies that make the individual worker absorb uncertainty.

According to Saskia Sassen (2000, 2001), Hong Kong is among the many global cities that espouse neoliberal policies that entail privatizing social services, reducing welfare spending, and decreasing regulation. In other words, the Hong Kong government has shifted its efforts from providing social services and welfare to assisting citizen-subjects to optimize their competitiveness and to become calculative and self-enterprising, thus easing the financial responsibility of the state onto its citizens (see Chan, 2004; Ku & Pun, 2004; Ong, 2006). Individuals who try to address uncertainty by taking risks are not guaranteed to be more competitive. Further, workers are largely expected to pay for their own flexibility training. HKSAR's first chief executive, Tung Chee-hwa, iterated the government's push for life-long learning and self-improvement for its residents, while only partially funding such options for improvement (Tung, 2001). While the rhetoric of neoliberalism gives a rationale for empowering all people, neoliberal policies implemented in the 1990s have actually entrenched social divisions by shrinking the middle class and empowering the rich (Ku and Pun, 2004, p. 7).

Thus I contend that the entrepreneurial environment of filmmaking in Hong Kong is not a byproduct of Hong Kong Chinese peoples' "natural" propensity toward hard work and freewheeling business skills, as many colonial, scholarly, and governmental sources have claimed. Rather, the entrepreneurial and "flexible" ethos is actually the result of a nexus of ideological interests deployed to benefit the managerial forces, privatization, and free-market principles of a postcolonial government that buttresses global capital. In other words, "flexibility" represents a careful construction, created by political and economic forces that cleverly articulate cultural notions of "adaptability" (Ku and Pun, 2004, 1); members of the Hong Kong media personnel themselves cite many of these forces as "very Chinese," in what can be perceived as an instance of cultural essentialism.

The ideological influences of colonialism have also left a legacy that contextualizes media personnel's distaste for labor unions as detrimental to the Hong Kong film industry and its entrepreneurialism. Hector Rodriguez (1999) has carefully illustrated that the absence of unionized film labor in Hong Kong resulted from various actions the British colonial authorities exerted on the left-leaning members of the film community over the past century. These efforts included a clampdown on collectivizing film practices such as Marxist study groups, cooperative screenwriting, and educational film contents, which were brought over from the mainland. Over decades, waves of labor strikes in Hong Kong had been sparked by key periods of anti-imperialism in mainland China. During one active phase of anti-colonial and pro-China activities in 1952, leftist Hong-Kong film workers agitated for back payments by striking against a privately owned film company. In response, the British deported over 20 of the film workers on strike, who were suspected of abetting the People's Republic. The British colonial authorities "wanted to promote an apolitical public culture hostile to the formation of oppositional organizations" (p. 111). They encouraged the growth of "right-wing" private film companies that disregarded trade unions, such as the Association of Cantonese Film Workers, and they established ties

with Taiwan's anti-communist Guamindang (Chinese Nationalist Party) (p. 115). Taiwan's ministries offered funding, film distribution licenses, and tax deductions for Hong Kong films that were anti-mainland China. They also induced the famed Fordist Shaw Bros. and Cathay Studios film producers to sign pledges to cease distributing or exhibiting movies in mainland China: the ensuing period was known as the "Red Movie Ban." Rodriguez concludes: "Despite their claim to political neutrality, colonial authorities had actually worked to enhance the power of capitalist management" and of private film entrepreneurs (p. 111). The repercussions of these actions continue to be felt in the production culture today.

Socially Marginal Status of the Film Industry

"My parents and family are not happy that I work in the film industry, that I'm an actress. To them, it's not respectable," said Tammy, a Hong Kong actress in her fifties who still has to defend, periodically, her decision to pursue a film-acting career – to her parents, her husband, and her children. According to her, for a long time they saw her job, and the industry as a whole, as unsavory. They fear that her sense of responsibility and the performance of her familial duties are weakened by the long schedules that frequently put her in remote locations, making her work late hours – particularly for horror films and thrillers – and mostly in the company of male film personnel. The unease that Tammy's family feels about her participation in the film industry is not an exception. While many young people consider working in the film industry glamorous, some conservative or upper-middle-class families eschew this type of employment and its working conditions for the women in the households. Their fears reflect the marginal status of the film industry, especially among some of the older generation and more conservative members of Hong Kong society.

In this section I explore aspects of the sociocultural character of the Hong Kong film industry that are enmeshed in its discursive themes of decline and flexibility. The characterization of the film industry as *lo pin moon* still lingers to some degree; this is a Cantonese expression that translates as "mix with slanted-door business" – as opposed to involvement with a "straight-door" business such as law or medicine. In other words, the film industry (like the commercial film industries of Bollywood and Hollywood) is a dubious environment (Ganti, 2004; Horne, 2001). Some members of the media personnel articulated the illicit and socially marginal perception and practices of the film industry as something they want to change, for the overall benefit of the industry as well as for themselves.

After discussing some of the reasons for, and some of the manifestations of, the socially marginal status of the film industry, I will now outline ways in which media personnel members have addressed this problem.

One of the reasons for the societal perception of the film industry as *lo pin moon* is that, in the past several decades, Hong Kong's film industry acquired a history of

illicit financing, and even of gangster managerialism (Curtin, 1999, 2010; Stokes & Hoover 1999). Numerous interlocutors in my fieldwork recalled that, in the 1970s and 1980s, gangsters could assist location filmmaking in certain neighborhoods through their social influence over shopowners. They could also rob or harass film crews, sometimes harming or stealing equipment. Seeing the profit potential of film production, some of the more entrepreneurial gangsters then transitioned to financing and managerial activities by offering loans to cash-starved producers during the 1980s and 1990s. The *hak seh wui*, “black societies” or “triads,” frequently cycled the cash through production, simultaneously laundering the money they had acquired from other illicit activities. Some triads became more involved in financing film projects and eventually set up production companies, becoming creatively as well as financially invested in production (Curtin, 1999, pp. 37–38). The stature of Hong Kong as a legitimate destination for overseas film crews was shaken, which resulted in on-set violence and in a shooting incident that led to protests in the streets.¹¹

Prominent members of the film industry have commented that some members of Hong Kong society do not think the film industry is a respectable trade. A producer remarked to me: “This is a dirty business, with dirty people. You have to be very, very careful.” Another Hong Kong director Peter Chan explained further:

The film business is seen as something that is not professional, and with triad involvement, it was something that you don’t want your children to work in [...] As a result, nobody else wanted to touch the film business. Even the Hong Kong government took the attitude that they didn’t want to deal with it. They just didn’t want to hear from us. (Curtin, 1999, p. 75)

Children from “good families” are expected to become scholars or government officials, not performers. Producer Nansun Shi observed that working in the film industry is “not the sort of business that gets respect from the government or from investors” (p. 75). The reasons for this state of affairs are complex. The Hong Kong government’s distance from the film industry may be attributable to Hong Kong’s geopolitical status, first as a colony of Great Britain and then as a region of China. Its cinema lacked the potential to become an instrument in nation-building, unlike what happened in other Asian countries, which have backed their national film industries in the past decade (Davis & Yeh, 2008; and cf. Jin in this volume). There are also gender and class dimensions to these perceptions. The work on set may involve physically intimate encounters in the course of undressing and grooming, and these can put women in an uncomfortable position. Working on film sets also requires the public performance of sentiments that may be socially regarded as private.¹² Unlike some traditional Cantonese opera troupes that traveled throughout the region with family members who would perform, contemporary media workers lack the oversight and protection of their kin.

The reactions to film workers from family members are neither simple nor straightforward. Several female interlocutors spoke of the ambivalence that family

members, particularly parents, felt towards these women's on-camera work. They disapproved of the women's physical and emotional exposure as a form of spectacle, and yet they took pride in the same women's ability to find work in a competitive industry. Respectability was less of an issue for females who worked in wardrobe or production coordinating. Many of them received training in film or art and were seen by their peers and families as artistic, media-savvy, hip, and – importantly – not part of the spectacle itself. Actresses were, in some ways, the most vulnerable sector of the film industry – the object of the (mostly male) on-set gaze, sometimes subjected to more complicated managerial relations.

Responses to the Industry's Socially Marginal Status

One of the most visible efforts to minimize the *lo pin moon* association of the film industry has been the professionalization of certain companies through the transparency and standardization of business practices. Instead of the “casual accounting practices” of many small production companies (Curtin, 2007, p. 74), including verbal deal-making and minimal paper trails, some companies have become more corporate by devoting more time to developing and planning production. One such company is Media Asia, a production company with origins in film distribution. Media Asia has been a prominent company for regional co-productions, distribution, and exhibition in China (Davis & Yeh, 2008, pp. 106–107). It has collaborated with Singaporean and Japanese companies, as well as with the “state-run” conglomerate China Film Corp. The company is known for “meticulous calculating [...] a rarity in impetuous Hong Kong film culture” (p. 106). It primed itself for external investment by adhering to the strictures of transparency and standardization found in other corporate structures. Such strictures required complete scripts and “signed formal contracts with personnel, got completion bonds, relied on insurance, marketing campaigns and other legal apparatus to present a professional, polished package” (ibid.). Not only has this kind of standardization and corporate organization helped keep Hong Kong-based production companies competitive in the global market and up to the task of co-producing with Hollywood, it has also granted them greater socioeconomic respectability. Legal and financial disclosures may not make the social and financial relations of production truly “transparent,” but such steps have marked a shift from some of the more secretive practices of family-run and triad-related production companies. More importantly, standardization and transparency in accounting and in script development, together with the rationalization of production labor, cohere more closely with the business practices of the regional offices of Anglo-American and European legal, financial, and accounting firms in Hong Kong, versus the triad-production companies of the 1980s and early 1990s.

There are more dispersed, yet salient ways in which media personnel members have attempted to recast the film industry – and themselves – as more respectable. The growing popularity of evangelical Christianity among media personnel in Hong

Kong has become evident in the form of Christian faith-based support groups for media personnel, loosely clustered prayer groups, and membership in Christian groups on social-network sites such as Facebook.¹³ The Christian networking and support for the self-styled “born-again” Christian media personnel provides what some have described as a “moral compass” and a sense of legitimacy in an industry that is still attempting to shake off its history of dubious business practices. At numerous production meetings I attended and in several interviews, media personnel incorporated prayer, born-again testimonials, and biblical quotations and references into conversations about their career aspirations and their production practices. Evangelical practice and protection has been particularly important for female workers who film late at night in rural areas, far from the city. Susan, a “born-again” actress who had appeared in sexually provocative material years before, has been able to reinvent her image and her reputation among film personnel, so that she can more easily maintain a distinction between her on-screen and her off-screen persona. Wearing a necklace with a cross, invoking the name of Jesus in production meetings, and praying aloud before meals shared with other media personnel are among the socially recognizable Christian practices that Susan engages in in order to identify as born-again Christian. Through religious practices of prayer and through participation in faith-based networks, Susan feels spiritually protected by what I consider to be a mantle of Christianity, a protective shield that buffers her while she is filming provocative material. Susan also networks and affiliates herself with similarly Christian film personnel, joining Christian groups on Facebook and seeking occasional film projects that hold a Christian, albeit also a commercial, appeal. A female producer-director whom I observed on set and in production meetings remarked to me that her robust brand of Christianity is what reassures her family members that she is safe working in what they had considered a *lo pin moon* industry. She describes her Christianity as protecting her from unsavory business practices and unwholesome behaviors, particularly with men. Evangelical Christianity was described by these workers as emphasizing a “take-charge” approach similar to that of the entrepreneurialism propagated by the SAR government, but this time with the aim of producing cultural, not economic, capital. These examples show how sociocultural practices are selectively incorporated into industrial activities and work practices as tactics designed to provide protection in an industry whose personnel faces multiple forms of risk.

Conclusion

This chapter has provided an overview of the production culture of the Hong Kong film industry in order to show how the interrelated themes of decline, flexibility, and marginal social status have constituted definitive elements over the past decade. The decline of the film industry has followed from multiple causes and has generated a

productive reflexivity on the part of media workers, who have engaged in flexible practices to revive the industry and their own careers within the East Asian market. These flexible practices include individuals' increased geographic mobility, as well as industrial co-productions. While Hong Kong film productions have for decades been partly filmed or financed from overseas, Hong Kong film after reunification has evolved into a broad enterprise dispersed across East Asia. Lastly, in examining the socially marginal character of the film industry – and various responses to it – we see how media production draws from and reassembles facets of business practice and religion.

Further analysis of media production in non-Western and Western production sites can explicate the conditions in which such powerful cultural forms as film are produced. These conditions eventually form the ways in which the media are received and potentially transform peoples' lives (Appadurai, 1996, pp. 40–41). In examining the production culture of the Hong Kong film industry we see in what instances the cultural and political history of the territory shape and shade the meanings that arise within the social communities of media personnel. An issue such as that of mainland Chinese censorship, which requires new tactics on the part of those Hong Kong media personnel members who exchange a degree of cinematic autonomy for mainland financing, is just one example of how negotiation and discord within the industry are impacted by geopolitics. Indeed, a production culture cannot be separated from the larger cultural practices and social formations in which it occurs.

NOTES

- 1 A salient feature of Hong Kong's economy was "positive non-interventionism," a colonial policy pursued by Hong Kong in the 1960s to maintain an open and "free" economy without government intervention (Castells, 2000; Ngo, 1999; So, 2004).
- 2 These themes of cultural identity have been explored by Hong Kong filmmakers such as Wong Kar Wai, Ann Hui, Johnnie To, Fruit Chan, Stanley Kwan, and Peter Chan.
- 3 For a thorough treatment of the TV industry in Hong Kong and its relationship to film, see Michael Curtin, 2007; Ma, Eric Kit wai, 1999; and Keane, Fung, & Moran, 2007.
- 4 Due to institutional review board regulations (IRB) for this project, the confidentiality of all research participants must be maintained.
- 5 For a postcolonial analysis of this transition, see Rey Chow's critique of the British colonial government's push to introduce and accelerate "democratic" measures through the Hong Kong government only after Hong Kong's return to China was mandated in 1984, as a tactic to contrast favorably the benevolence of British colonial rule and its legacy of "democracy" with the ostensibly oppressive regime of the People's Republic of China (Chow, 1998). As Alvin Y. So explicates, when Hong Kong was a colony of Britain, "[t]he British Parliament directly appointed the Governor of Hong Kong, and British expatriates ran the colonial state. The Hong Kong Chinese had no voting rights and no power to select their own governor. Although the colonial state is often labeled a liberal state, it had many repressive laws to restrict the civil rights of the Hong Kong Chinese, such as a Society

- Ordinance to control the kind of organization allowed to operate in the colony, and it banned publications that criticized the colonial state" (So, 2004, p. 237).
- 6 CEPA has been implemented in various phases; currently, under phase III, as long as Hong Kong film and television scripts receive approval from mainland censors, Hong Kong films and television shows are not subject to import quotas and are distributed in mainland China. Hong Kong production companies may own more than 50% of the copyright of films co-produced, and Hong Kong residents comprise more than 50% of the total number of principal personnel in the motion pictures concerned (such as director, screenwriter, leading actor, leading actress, supporting actor, supporting actress, producer, cinematographer, editor, art director, costume designer, action choreographer, and composer of the original film score) (Davis & Yeh, 2008, p. 103).
 - 7 This is beginning to change: in 2009 the Hong Kong Film Development Council stated on its website that one of its goals is to provide educational seminars for its personnel (Hong Kong Film Development Council, 2009).
 - 8 This statement is based on participant observation of Hollywood production practices, conducted over several years at studio lots and on location sites.
 - 9 While interviewing this Hong Kong filmmaker on his Hollywood film set, we observed the grips taking time to stop and joke around as they rigged the dolly track. One of the grips lit up a cigar and smoked it while working. Although it is very common for media workers on production sites all over the world to smoke a cigarette while they work (and especially in Hong Kong), a cigar conveys a tone of luxury, more appropriate to a salon than to a set. The director nodded at the cigar-smoking grip, sighed, and complained quietly to his Hong Kong cinematographer and to me: "It's like they are standing around at a party, so social. Hong Kong crews work much quicker." His cinematographer nodded his agreement.
 - 10 For example, this producer was taught that, when she is out of work, as can commonly be the case when the film industry takes a downturn, she should say "I am overseeing several projects in various stages of development" – a phrase not likely to be taught in a regular English-language course in Hong Kong.
 - 11 In the late 1990s many of the triads pulled out of film production, partly on account of their mismanagement of funds and lack of filmmaking savvy (Curtin, 1999, p. 37). Some of these groups turned to video compact disc (VCD) piracy.
 - 12 For analogous examples among the Hindi film community and Tamil stage performers, see Ganti, 2002 and Seizer, 2000).
 - 13 These practices are not to be confused with The Media Evangelism Ltd of Hong Kong, which is a charitable Christian media organization.

How Should We Think About Audience Power in the Digital Age?

Joseph Turow

ABSTRACT

This chapter emphasizes the workings of corporate power in people's core relationships to the emerging digital media system. Its aim is to provide a counterbalance to a perspective with a lot of traction among contemporary academics: that the best way to think about audiences in the new age is to emphasize that individual audience members are exercising unprecedented control over the creation and distribution of media products. Focusing on the media-buying sector of the advertising industry, this chapter outlines the contours of a new ecosystem of digital-marketing companies that buys and sells data about online users without their permission or knowledge. This ecosystem raises a new version of the concerns about media's constructions of society for society that scholars first expressed in the late nineteenth and early twentieth centuries.

This chapter emphasizes the workings of corporate power in people's core relationships to the emerging digital media system. Its aim is to provide a counterbalance to a perspective with a lot of traction among contemporary academics: that the best way to think about audiences in the new age is to emphasize that individual audience members are exercising unprecedented control over the creation and distribution of media products. My exploration here centers on a corporate arena that academics

tend to ignore: the media-buying sector of the advertising industry. Media buying involves purchasing space or time for advertising on outlets as diverse as television networks, billboards, radio stations, websites, mobile-phone decks, and newspapers. For decades, this activity was a backwater, a service part of advertising agencies that hired liberal arts majors just out of college for the lowest-paying jobs on Madison Avenue. That has changed. During the past 20 years, media-buying firms and a wide array of satellite companies that feed them technology and data have become lucrative magnets for software engineers and financial statisticians.

What they are creating is nothing less than new ways of thinking about audiences, of trading them, and of defining success in doing that. A new ecosystem of digital-marketing companies unknown to online individuals buys and sells data about them – including inferences based on those individuals’ own online creations – without their permission or knowledge. Media-buying agencies and their advertising clients increasingly apply the information to determine what commercial messages individuals should get, what discount coupons they ought to receive, and what prices they should pay for products and services. The surreptitiously constructed market-driven profiles are also central to media firms’ increasing competitive need to personalize information, news and entertainment. Built into the logic of these activities is social discrimination across a widening digital landscape. The trajectory raises a new version of the concerns about media’s constructions of society for society that scholars first expressed in the late nineteenth and early twentieth centuries.

Media, Audience, and Community

Nicholas Negroponte was at the leading edge of academics who predicted that the power of the individual will be huge in the digital age. In the 1990s he headed the Massachusetts Institute of Technology’s Media Lab, a hothouse for computer-based inventions supported by major corporations. His bestseller *Being Digital* was published in 1995, just a few months after the introduction of Netscape Navigator – the web browser that began to open gates to the Internet for non-techies. Negroponte (1995, p. 5) predicted how communication technologies of the early twenty-first century would allow us to become the captains of our own attention, to focus our interests on what counts for us. “Your telephone won’t ring indiscriminately,” he wrote. “It will receive, sort, and perhaps respond to your incoming calls like a well-trained English butler.”

Negroponte seems to have taken it for granted that the creators of the new media technology would tilt it toward the individual’s interests rather than toward those of the commercial or governmental spheres. It also made sense to him that users of the new media technology would revel in that individualism. The idea that, in the twenty-first century, individuals would hold power over media destinies took hold. An important book to trumpet this idea positively, from economic and legal

standpoints, was Yochai Benkler's *The Wealth of Networks*. A cover blurb by University of Virginia communication professor Siva Vaidhyanathan accurately described it as "a lucid, powerful, and optimistic account of a revolution in the making." Underscore the word optimistic. As Benkler (2006, p. 2) saw it, the technological openness and flexibility of the Internet would allow individuals unprecedented opportunities to collaborate outside of traditional business frameworks, toward the creation of an astonishing new world. "This new freedom," he wrote, "holds great practical promise: as a dimension of individual freedom; as a platform for better democratic participation; as a medium to foster a more critical and self-reflective culture; and, in an increasingly information-dependent global economy, as a mechanism to achieve improvements in human development everywhere."

Paralleling Benkler's bold claims for the collaborative efficiencies and individual creativities afforded by new information platforms were assertions that the new technologies provide people with previously unheard of levels of power to follow their individual interests. Some pointed to the positive potential for that power; others to its negative implications. Cass Sunstein took a dystopic slant in *Republic.com* and related writings. "The most striking power provided by emerging technologies is the growing power of consumers to 'filter' what they see," he stated in an often-cited line (Sunstein, 2007, p. 5). To Sunstein, the ability to customize news sites by topic, to skip unpalatable topics, and to find comfort in ideologically similar blogs meant that people can live in idea cocoons either of their own making or in the making of which they collaborate with people who agree with them – a phenomenon that Sunstein called cyber-polarization.

Henry Jenkins saw these same individual powers quite differently. In *Convergence Culture* (Jenkins, 2008) and in other works, his focus was on very active contemporary audiences, which often push media companies to include them in their activities across multiple platforms, from television to magazines to fan conventions. It was a celebratory view, which reveled in people's growing influence on their symbol-making environment. What concerned Jenkins was not ideological polarization, but teenagers' cluelessness about what is appropriate when confronting the liberating technologies of the digital revolution. "The world has suddenly developed a printing press for every person on the planet," he told Singapore's *Straits Times*, in response to consternation manifested there about a young woman who posted nude photos of herself on her website, "but it has not prepared its culture to be responsible or imagine the consequences of suddenly becoming media makers" (see Suk-Wai, 2007).

Jenkins overreached in his assertion: there surely are places where not everyone has even the most widespread digital medium, the cell phone – places, in fact, where those who have phones cannot afford to continually charge batteries for them. His basic point, though, is quite reasonable. Digital technologies *are* providing more people than ever with the tools for being media makers, and so for reaching out to more people than ever. Similarly clear in the new media landscape is the proposition that individuals are captains of their own interpretations and increasingly use them as starting points to create culturally exciting or politically dangerous worlds of

understanding, for themselves and others. Yet his contentions and those of others (for example, those of Shirkey, 2010) about digital powers to the people beg an important question, which the proponents of such views almost never raise: Is the new individual and group autonomy the central force that will shape the way in which US citizens and others learn about the world and realize opportunities to benefit from it? Are other factors emerging that will be as decisive, or even more so?

The basic question is certainly not new with the digital age. Since at least the late 1920s, academics have disagreed about the primacy of human agency versus the power of media industries in shaping people's views of the world. During the first quarter of the twentieth century many sociologists and political researchers began to argue for the importance of seeing the media as an institution endowed with the power to construct society for society. Sociologists John Dewey (1927), Robert Park (1922), and Charles Cooley from the University of Chicago were especially noteworthy in emphasizing that the pattered messages that mass-produced periodicals circulated among millions of people allowed for the creation of a new type of broadly-shared sense of American society even if people were separated by space and class. While they tended to write optimistically about ways in which the mass media could help society maintain an informed democratic public, political theorists were revealing a dark side to the media's community-making capabilities. Academics of the 1920s, 1930s, and 1940s such as Harold Lasswell (1927), Leonard Doob (1935), Alfred McLung Lee (1937), Ralph Casey (1939), and George Seldes (1938) worried that mass media organizations were powerful definers of society's issues and interests in the service of the rich and powerful. They felt that, by letting people know how media firms operate, they could help citizens protect themselves from the undue power of those firms to set content agendas that reflected the needs of marketers and other members of the political and economic elite.

Beginning in the 1920s, the individual view also gained strong academic attention. Especially noteworthy was a raft of major quantitative studies coordinated by the Ohio State University (Charters, 1933) showing that personal background characteristics led people to interpret what they heard, saw or read from the media in their own ways. During the 1930s and 1940s researchers at Columbia University (e.g. Lazarsfeld & Stanton, 1941; Lazarsfeld, Berelson, & Gaudet, 1944; and Katz & Lazarsfeld, 1955) and the US military (e.g., Hovland, Lumsdaine, & Sheffield, 1949) added evidence to the argument that media have far more limited power to change people than many in society thought. Quantitative studies that supported this "active audience" view also emphasized people's power to choose the gratifications they wanted from whatever media content they selected. In the post-World War II struggle for mainstream academic space within the communication field, the idea of individual autonomy overshadowed the institutional view. Nevertheless, a new stream of critical communication researchers inflected by Marxist perspectives (for example, George Gerbner, 1972; Ariel Dorman and Armand Mattelart, 1975; Herbert Schiller, 1969; and Dallas Smythe, 1977) argued that individual autonomy actually paled in the face powerful business institutions. The capitalist system, working with

government, they insisted, created the broad social and cultural agendas from which audience members had the opportunity to choose their materials.

Contrasting academic insights about audience power also converged on qualitative cultural studies. From the 1940s through the 2000s, left-leaning interests in historical and textual aspects of popular culture underscored the importance of understanding the industrial production of culture if one is to lay bare the dynamics of institutional power. One can certainly see this theme in the writings of the Frankfurt School (Theodor Adorno, Leo Lowenthal, and Herbert Marcuse), of the US mass culture debaters of the 1940s and 1950s (Dwight MacDonald, Irving Howe, and David Riesman), and of British cultural-studies theorists (Raymond Williams, Stuart Hall, and David Morley) from the 1940s into the 1980s. (See Rosenberg & White, 1957, for a classic compendium of readings from the Frankfurt School and from mass culture debates; also see Williams, 1973; Hall, 1982; and Morley, 1980). Yet by the 1980s disappointment that powerful culture-producing systems wouldn't respond to demands for substantial change coincided with quite a different analysis: that the actual meaning of a media article, song, sign or video came not from its institutional creation but from its individual receiver, who could often be seen to create interpretations that resisted authority. One marker of that view was Janet Radway's (1991) description of female members in a romance-novel club. She showed how, in order to fit their own emotional desires, these women essentially rewrote formularized stories that, on the surface, echoed a male-dominated sexual world. Another marker was Dick Hebdige's (1981) research on British punk, which explored how those who followed the lifestyles expropriated different aspects of contemporary taste in clothing and decoration in order to fashion their self-images. The work by Negroponte, Benkler, and even Sunstein fits neatly into this corpus, which a commentator (Chavez, 2009, p. 904) described as indicating the means "by which consumers may control commercial meaning."

Scholars with an institutional perspective and an eye on the emerging digital world have pushed back against this conclusion. One line of critique, drawing from critical political economy, points to the huge corporations that control the content that people are supposedly using autonomously in the fragmenting environment. Robert McChesney is a proponent of this view in works such as *Rich Media, Poor Democracy* (McChesney, 2000). He finds the key challenges to civic life to be not in the self-polarizing activities of individuals but in industry consolidations and in often secretive corporate strategies (enabled by government policies) over the ever-splintering media channels. A second stream of writings dives more directly into the human-agency fray. It sees the liberatory experiences that Jenkins and others have mentioned actually as a part of the strategies for exploitation. Mark Andrejevic (2007, p. 17) highlights various forms of corporate digital surveillance, in an attempt to counter what he calls "the ongoing attempt to equate new media technologies with the promise of empowerment, individuation, and creative control." Along related lines, Detlev Zwick, Samuel Bonsu, and Aron Darmody (2008, p. 174) argue, for example, that media executives.

have begun to realize the benefit of providing individuals with places for playful production of their own consumption experiences, a fact demonstrated by the popularity of numerous massively multiplayer online role-playing games (MMOGs), open-source and hacker cultures, and fan communities. [...] Always on the lookout for new ideas, products, and services to market, managers are seeking ways to appropriate, control, and valorize the creativity of the common.

Dovetailing with this view of co-optation are variations on Dallas Smythe's 1950s notion of the audience as worker. Andrejevic (2007, 2003) argues bluntly that reality shows and user-generated content that sites such as Facebook use to draw advertising are direct examples of free labor in the interest of corporate profits. Other views try to accommodate both individual interests and corporate power. Tizziana Terranova (2000, p. 33), for example, emphasizes that in blogs, Facebook, YouTube, MySpace, and so many other places in the digital economy the free labor of consumers "is simultaneously voluntarily given and unwaged, enjoyed and exploited." Jose Van Dijck (2009, p. 41) pushes this understanding even further, arguing for "user agency as a complex concept involving not only his cultural role as a facilitator of civic engagement and participation, but also his economic meaning as a producer, consumer, and data provider, as well as the user's volatile position in the labour market."

As Van Dijck's formulation points to an important mixture of elements of individual autonomy amid corporate control, it implies the possibility of comparing the two assertions about audience power on the same plane. It's an important insight because, despite an ocean of writing about audience power over the past century, the viewpoints have typically drawn on virtually separate worlds of media scholarship for their evidence. The audience-autonomy realm tended to focus on social-psychological "effects" research, while the corporate power domain brought evidence from organizational and industrial practices. What is different about the digital environment is that both academics celebrating audience power and those emphasizing corporate influence over audience members have made their cases on the basis of the production and distribution of messages. Van Dijck's formulation falls short, however, in suggesting the relative importance of the individual versus the institutional position. Certainly, Andrejevic and Terranova make the case for corporate media power. The scope of their examples may not match the broad scope of autonomy that Negroponte, Benkler, and possibly Jenkins claim for individuals in the digital arena.

The following pages sketch a counterpoint that does have overarching implications. The thesis is that new media-buying activities are the fundamental vehicles through which corporate influences erode individual autonomy in the digital-media age. None of this denies the spaces for individual and group initiative that Negroponte, Benkler, Jenkins, Sunstein, and others identify in the new environment. The fundamental logic of the emerging media-buying system, though, privileges institutional power. It aims to constrain individuals' everyday media contexts, as well as to channel audience choices and initiatives toward the goals of marketers and of publishers – that is, the creators and distributors of content.

The Transformation of Media Buying

Advertising lies at the core of much of the media, and it is the force that sustains much of the content on the web, including many – if not most – bloggers. At base, advertising involves payment for media attempts to persuade people to purchase or otherwise support a product or service. Most people likely think of advertising in terms of its most visible manifestation: the persuasive message. Yet the definition suggests two sets of activities in addition to the creation of the ad. One, which is part of marketing research, entails evaluating whether and how the message worked. The other, traditionally called media planning and buying, revolves around the provision of funds to pay for placement of the notice. Before the 1980s, advertising practitioners considered media buying and planning as rather straightforward, unexciting components of a standard (“full-service”) agency’s offerings to clients. During the US broadcast television era (roughly, 1948–1988) the media-buying process became so predictable for national advertisers that many outsiders considered buying print space and broadcast time for clients a paint-by-numbers activity. They understood that a large part of the overall agency revenues typically came from the (then standard) 15% commission garnered from what clients spent to place their commercial messages. But they also knew that most of the work was conducted by low-paid recent college graduates who poured over boring television ratings and periodical circulation data in conjunction with advertising charges to determine the key measure of an ad vehicle’s efficiency: CPM (cost per mil), the price for reaching 1,000 members of the target audience via that outlet.

In the 1960s and 1970s media-buying independents (those disconnected from advertising agencies) emerged in Europe and North America. The clients of these firms were not the blue-chip advertisers that full-service agencies on both sides of the pond coveted. Independents tended to attract direct-marketing companies that created their print ads or TV commercials themselves and needed an intermediary to buy space or time for them. Beginning in the mid-1970s, though, major advertisers in the UK began to accept that standalone buying firms sometimes had more expertise than buying units of full-service agencies. In 1988, advertising-agency entrepreneurs Maurice and Charles Saatchi bought the dominant independent buying firm and merged it with the media-buying activities of their three UK ad agencies into one standalone subsidiary, Zenith Media, with huge billings. A major rationale for media-buying agencies of Zenith’s size was that it would help clients face two critical developments efficiently. One was the ongoing fragmentation of electronic media as commercially supported cable, satellite, and radio channels proliferated in Europe, the US, and other parts of the world. A large buying firm, advocates said, would have the staff and computer facilities to analyze the best media mix for each client’s products in this intimidating new arena. The other development was the growth of huge conglomerates (Time Warner, Disney-ABC, News Corporation, Viacom-CBS) that owned many advertising platforms in different media industries and could potentially

raise the price of time and space. Supporters of large media-buying firms contended that their hundreds of millions of dollars from multiple clients could act as a counterweight to the media firms' clout during bargaining over prices and placements.

Zenith marked a focus on standalone media-buying divisions – a focus placed by the agency-holding companies that were beginning to emerge in the UK, France, and the US. Driving the holding companies' growth was the notion that dominance in all parts of the industry could be achieved by buying a number of full-service ad agencies with worldwide networks, great creative boutiques, and allied businesses such as public relations outfits. The first agency-holding company, Interpublic, was actually founded in 1960; but the notion did not catch on until the 1980s. The 1990s saw enormous struggles for position and control over agency conglomerates, as well as over their media-buying divisions. The four dominant worldwide holding companies that exist today emerged by the early 2000s: Omnicom and Interpublic, based in New York; WPP (originally Wire and Plastic Products Plc.), based in London; and Publicis (which had absorbed the Satchis' holdings), sited in Paris. In addition to these were two firms with French pedigree, which held a particular claim to fame as buying authorities: Aegis, based by then in London; and Havas, based in Suresnes, France. These six were eventually quite successful at dominating the territory. According to a research firm that keeps track of buying-firm developments, they spent \$224 billion advertising dollars worldwide in 2009 (RECMA, July 2010). That year the six firms controlled about 45% of purchasing in the US advertising market; in most European countries the share reached 80% (RECMA, July 2010).

The 2000s marked a period when the major buying firms began, with their quantitative audience-targeting models, to earnestly exploit the rise of the commercial Internet as a testing ground for the coming age of ubiquitous digital media. Although advertising "online" appeared during the 1980s on computer dialup services such as Prodigy, the business was marginal and ad agencies didn't consider that it had mainstream possibilities. The growth of commercial advertising on the World Wide Web with the introduction of the Netscape browser in 1994 pointed to a venue for marketers to reach millions of audience members. The second half of the 1990s marked a transition period during which publishers and various partners refined three technologies that would become the basis for the audience-marketing logic that took flight in the next decade: the banner, the interactive link, and the cookie.

The banner and the advertising-oriented link seem to have emerged together on October 26, 1994, when the popular online technology magazine *Wired* began to sell pictorial banners in large quantities on its new website Hotwired.¹ Soon thereafter Netscape employees Lou Montulli and John Giannadrea revolutionized advertising by creating the cookie, a small text file that a website could place on a visitor's computer. They were responding to online retailers complaints that they couldn't handle customers' multiple purchasing requests (Schwartz, 2001). Every click designed to put an item in a virtual shopping cart would appear to the online store as if it were made by a different individual. Consequently, a person would not be able to buy more than one thing at a time. Montulli and Giannadrea made the cookie with an

identification code for the visitor and codes detailing the clicks that the person had carried out during the visit. The next time the person's computer accessed the website, tags on the browser would recognize the cookie. Note that the cookie could not by itself distinguish between two separate people using the same computer. That was the result of Montulli and Giannadrea's decision to have the cookie work without asking the computer user to accept or contribute information to it. There was an ominous downside to that seamless approach: by not making the computer user's permission a requirement for dropping the cookie, the two programmers were building a lack of openness at the center of the consumer's digital transactions with marketers.

During the 1990s and into the 2000s, marketing technologists developed other methods for following individuals through the digital environment. A web beacon (or tracking pixel) is a graphic on a web page or in an email message that often activates a program in order to monitor the activity of visitors – for example, what they read and for how long. A Flash cookie (technically, a locally shared object) is a collection of cookie-like data stored as a file in a user's Adobe Flash computer software; marketers sometime use it so that the data will not be lost when standard cookies are deleted. The development of the banner ad, the link, the cookie, the web beacon, and the Flash cookie helped digital divisions of media-buying firms and their technology partners to refine their digital trade through the 2000s to make it central to marketers considering advertising online. The essential approach was to emphasize that the new medium allowed for the quantitative measurability of audience activities in ways that would yield a much more accurate understanding of a client's return on investment (ROI) of its ad monies than had been possible with analog advertising vehicles such as newspapers, magazines, radio, television, and outdoor boards. Moreover, media buyers contended, it was now possible to go beyond measuring the responses of panels or samples of audiences, as had been the norm in the analog world. Now it was possible to note and store the responses of individuals via their click-like behaviors – for example, by using the mouse to activate a link, by moving a mouse to activate tracking pixels on an ad, or by pressing a button to change a channel or to choose a product on a television screen.

Initially the emphasis on quantitative measurement served a direct-marketing model of advertising. The goal was to provoke a sale or an action that would conceivably lead to a sale. The rapid rise of Google search as an advertising powerhouse, which began around 2001, was a result of an auction-based pay-per-click (PPC) revenue system that reflected this approach. Google initially carried its PPC model to the contextual advertising system that it established with sites throughout the web and in its Gmail service. In a contextual advertising network, when an advertiser bids for a keyword, the network's computers find a web page from the network's roster of sites that reflects the keyword. On the basis of the relevant context, the network serves the ad. If the visitor to the site clicks on the ad, the advertiser pays the agreed-upon amount and the network shares it with the website. Both in the advertising search and in the contextual advertising businesses, the percentage of visitors who

click might be 1% or less. But, with hundreds of millions of visits, Google could still make significant amounts of money with the PPC model.

While Google executives extolled this direct-selling approach as the purest example of web results in action, many web-content providers didn't have anything like the numbers of visits enjoyed by a search engine such as Google or by a "portal" such as Yahoo. These smaller publishers preferred to sell display advertising on a "cost per thousand impressions" basis that paralleled the tradition of newspapers, magazines, television, and other analog media. The logic was that ads for companies that sell cars, financial services, and movies may not need to yield a click action to have an impact on a person's image of the product and on future purchase decisions. But this forgoing of the direct-click payment model of advertising sales didn't mean that media buyers were giving up on their insistence that the web was a more measurable platform than traditional media. Instead, media buyers and publishers advanced new ideas of how to think of the success of image ads that could be measured even as they paid on a CPM basis. Some of the notions centered on "engagement" – time spent on, or interest in, the page with the ad was an indication of the opportunity to see with it. A different way to think of the measurability of an image ad's success was to look at whether viewing an advertisement at one point led to the purchase of a product at another point – either on the web or off it. This definition of success – call it *the long click* – became an important reason for following individuals' activities across media, and ultimately from online media to offline retailers such as supermarkets and car dealers.

In all these cases, fierce competition for dollars led publishers to garner visitors' characteristics and to sell that information along with their engagement possibilities. Keeping people's names and email addresses off limits (and calling it anonymity), some sold segments with demographic information such as age, sex, geographic area, income and employment status they got from registration or bought from data firms. The ability to use cookies and, later, web beacons to tag audience members and to track what they viewed allowed publishers to create and offer up segments of inferred interests to advertisers, who might in turn infer purchasing interests from those segments. Advertising networks were doing the same thing, though across websites, and they and data-collection firms often "matched" their cookies with the cookies of other tracking firms, to enhance the ability of advertisers to target very specific types of individuals – and often even very specific (though still anonymous) individuals. By the late 2000s, audience-data exchanges owned by Google, Yahoo, Microsoft, Interpublic and other major players facilitated the auction of individuals with particular characteristics, often in real time. That is, it is now possible to buy the right to deliver an ad to a person with a specific profile at the precise moment at which that person loads a web page. In fact, through cookie-matching activities, an advertiser can actually buy the right to reach, on an exchange, someone whom the advertiser knew from previous contacts and was now tracking around the web.

Through these processes the audience became a focus of reconstruction for marketers and content firms. A variety of organizations emerged to help marketers find

the specific audiences and audience members they wanted at the lowest prices possible, while a variety of others emerged to help publishers provide those audiences but keep prices relatively high. Media-buying firms struggled to find their place as advertising networks and media-buying platforms threatened to usurp buyers' key functions of planning the best roster on which to advertise and of bargaining for the best price. The ecosystem became denser as the amount of money advertisers spent online expanded dramatically, from around \$9 billion in 2003 to around \$34 billion in 2008 (Veronis Suhler Stevenson, 2009, Table 11.8). A chart circulating within the trade during 2010 (Kawaja, 2010) depicted 22 types of organizations between advertisers and publishers. In addition to *agencies* with media-buying divisions (WPP, Publicis, Havas), it listed categories such as *ad exchanges* (DoubleClick, AdECN), *ad networks* (AOL, Google, Microsoft), *yield optimizers* (Rubicon, PubMatic), *ad servers* (DoubleClick, Atlas), *data qualifiers* (DoubleVerify), *analytic specialists* (Omniure, Coremetrics), and *research operations* (comScore, Nielsen, Quantcast). All the companies represented in these categories have the following operations as their core aims: assembling data about the audience (or *consumers*, *visitors*, *targets*, or *users*, as audience members are variously called); trading the data about them; trading access to the audience members; creating specialized display ads and videos for the targets; serving specialized ads to the targets; and/or evaluating the success of those activities.

Media Buying and the Exercise of Power

That advertisers can now buy the right to serve messages to, say, 26-year-old Southern US fans of the film *The Princess Bride* may seem like a trivial concern. But this capability, highlighted in press articles about digital privacy (see, e.g., Angwin, 2010), only scratches the surface of what firms can learn about individuals – and about what they can do with what they learn. Here are sketches of three ways in which the maturing digital-industry logic increasingly encourages profiling people without their knowledge, shares these profiles across marketers and websites, and narrows audience options regarding not just advertising but prices, news, and entertainment.

(1) *Individual marketers construct a flow of information and inferences about individuals and increasingly tailor ads and offers to them.* The impulse guiding this approach is encapsulated in a Powerpoint deck that Publicis' MediaVest buying operation presented to its clients during 2010. Headlined "Why We Are Betting on Ad Exchanges," the first slide offered the basic explanation for MediaVest's decision to put its energies into the new approach to advertising spending: "Key benefit: Buy only the impressions that match." Two columns of text then elaborated the point, which was also illustrated by a series of pictures descending with them. One column highlighted the key chain of thinking about ad exchanges: "Insight / Media / Technology / No Waste." The other column elaborated on the flow of reasoning

in the following way: “Leverage our own data to create audience segments → Access millions of consumers through open ad impressions → Exchange allows all impressions to be ‘filtered’ → Buy only the impressions that match our segment.” The slide suggested that marketers would be able to reach only the people who count to them. MediaVest would create target segments on the basis of its clients’ data about best customers. It would then bid, in the exchanges, for the right to reach people who fit those profiles. They would get the client’s messages, and the audience reached would be free of “waste” – the term used for the population the client didn’t care to reach.

The approach is by no means confined to MediaVest. It is becoming a standard operating procedure among media buyers in the big six firms, as well as in many of their smaller competitors. Marketers are increasingly using databases to predict whether they should consider particular Americans as targets or as waste. Those considered waste are ignored or shunted to other products, which the marketers deem more relevant for them. Those considered targets are further evaluated according to demographics, beliefs and lifestyle data about them that companies store and trade. They receive different messages and possibly discounts, depending on the profiles.

Advertisers and publishers point out that much of the cookie-connected information they use is “anonymous” – that is, not linked at the moment of use to the person’s name, postal address, or email address. Yet, if a company can follow an individual’s behavior in the digital environment – and that includes the mobile phone and, potentially, the television set – its claim that the person is anonymous is meaningless. That is particularly true when firms intermittently add offline information to the online data and then simply strip the name and address, to make it anonymous.

For Ford Motor Company, there is no question that targeted personalization – sometimes anonymous, sometimes not – is central to marketing strategy. Reflecting this idea, Andy Pratkin, the digital director of WPP’s Team Detroit agency, noted in an interview that his fundamental concern in reaching customers is with knowing how his prospective targets learn, how their perceptions are formed. He added: “If we can fit into that dynamic, we can fit into *her*” (Pratkin, 2010). Pratkin argued that the digital environment allows for an individual to be followed along a gauntlet of brand-related mind-sets, from awareness to initial attitude to various attitude shifts. “It’s kind of like dating,” he said. Consider just two of the ways in which Team Detroit cultivated online audiences for the Ford Motor Company’s advertisements during 2010:

- It purchased ads on many automotive sites and planted Ford cookies and beacons in the computers of visitors to the pages where the ads appeared. The technology allowed Ford to serve individuals different messages and photos, depending on what their clicks suggested to Ford about where they were in the car-purchase funnel. “We do a fair amount of tagging,” said Andy Pratkin (2010).

If people are exposed to our ad, we study their behavior, and if they come to our site, then we retarget them and try to entice them back [...] If you go to [the] Kelly Blue Book [website], we serve an ad. We'll know if you didn't do anything. Next time, we'll serve you a different ad. You go to our site, and if you do something and you go off our site [to one of Ford's advertising networks], we serve you other ads.

The technology often assembled the advertising automatically, on the fly, to match what cookie data said about the person's car-searching routines with the previous commercial messages that had been served to the individual.

- In other Internet buys, Team Detroit varied its ads to people on the basis of their ages, incomes, geographic locations, and various social behaviors, as well as on the basis of inferences from categories based on these data ("soccer moms," for example) that suggested they would purchase particular vehicles or would be persuaded in certain ways. In addition, the agency presented ads to the friends of people on Facebook who fit profiles of being in the market for particular types of cars. "On Facebook, you take friends into account," said creative executive vice president Scott Lang in an interview (2010). "So-and-so liked this; you will too. People find that creepy in the beginning, but [...] they slowly get used to it."

While Ford uses data and digital-targeting aggressively, Next Jump goes even further. This smaller but influential firm runs employee discount and reward programs on behalf of 90,000 corporations, organizations and club-like organizations (often called affinity groups) that reach more than 100 million consumers. The low profile results from Next Jump's desire to stand in the background, as a facilitator of deals. The capability it offers prospective clients on its modest website is certainly familiar in the digital age: "Create your own targeted ads on the Next Jump network [...] Promote your offers to interested users [...] Track marketing performance through insightful analytics [...] Discover and reward your most influential customers" (Next Jump, 2010).

How Next Jump does that is the secret sauce that founder and CEO (chief executive officer) Charlie Kim says augurs a new future for advertising. The business is based on the proposition that the best way to advertise is to present lower prices specifically to individuals about whom statistical calculations suggest that they would be the best customers to reach with a deal. According to Kim, Next Jump's conversion rate on product offers (that is, the ratio of offers to purchases) is 11 to 1, compared to 1,000 to 1 or worse, which goes for typical Internet ad-conversion rates. But not every advertiser can get the data to target individuals so carefully. What Next Jump has done was to insinuate itself directly into the fabrics of Fortune 500 companies and other larger firms by running the online purchasing programs that those firms set up as perks for their employees. Those firms pay Next Jump for its work on a "per employee" basis, but Next Jump seems to derive a lot more money from the fees merchants pay every time someone buys a product.

Next Jump therefore has a vested interest in increasing its purchases. Because the company operates discount programs for roughly one third of all US corporate employees, “it is considered a non-traditional benefits provider and gets updated weekly on the employment status of 30 million workers (who also happen to be consumers). It gets part of the employee record, including things like name, address, employment status, home and work address, marital status, and sometimes even job title or salary grade” (Schonfeld, 2010). To that information and to inferences about it (such as salary grade), Next Jump adds transactional data from the firms it deals with, as well as from credit companies. It then overlays all that with information it collects through the firms’ human relations departments and through employees about what people want and what they will pay for. With all that knowledge, Next Jump can make predictions about who should get what product email offer at what price. It also generates a “UserRank” score for every employee, on the basis of how many purchases a person has made and how much he or she has spent.

“Shopping and advertising has [*sic*] always been the same to us,” Kim noted in 2010. His goal is to separate consumers to the extent that the conversion rate (which in 2008 was 100 to 1) will get down to 3 to 1. He sees it as a statistical issue. Of his 225 employees, 150 are engineers. One analyst of the company noted the extension of his work: “If Kim keeps perfecting his shopping algorithms, you may never shop the same way again – and you won’t even know that you are doing anything differently” (Schonfeld, 2010).

(2) *Marketers, data providers, and websites create widening profiles for people that may affect the choices they receive from marketers at various locations.* The individual-level data that Next Jump uses in setting differential-pricing activities for its clients do not seem to leave its servers. Increasingly, though, the blending of conclusions about consumers’ online behavior with gathered (or purchased) information about them doesn’t stop at particular brands. To the contrary, the business of discriminating digitally is leading many marketers to a small number of firms that sell various sorts of information about online customers and potential customers. These agencies, in turn, get their data from a small number of primary sources. The data collectors match what they know about people online with information they buy offline. They then anonymize the cookies; the same data may be associated with the (anonymous) person in many cookies used throughout the web.

It is through the use of these cross-pollinating organizations that narrowed options and social discrimination widen their impact. The period during which the profiles exist is widening as well. Individual cookies may have a life of days only, because the people they track delete them from their computers. Digital publishers and marketers have, however, developed various techniques to keep a growing amount of information about anonymous individuals even after their standard cookies have disappeared. These approaches, plus the matching of cookies to share information

gleaned in different ways, mean that the profiles that publishers and marketers increasingly share broadly exist for an increasing amount of time.

Acxiom, a top US marketing-communication agency, is a good place to begin exploring the building blocks of information and how they travel across advertisers. The company says that it help clients “acquire, retain, and grow loyal (and profitable) relationships” in the digital media as well, especially via email, banner, search, website optimization, and mobile (Acxiom, 2008). Acxiom’s cross-advertiser reach is prodigious. It says the client list includes 9 of the top 10 automotive companies, 12 of the top 15 credit card issuers, 7 of the top 10 retail banks, 9 of the top 10 telecom/media companies, 7 of the top 10 retailers, 9 of the top 10 automotive manufacturers, 6 of the top 8 brokerage firms, 3 of the top 5 pharmaceutical manufacturers, 2 of the top 5 life/health insurance providers, 8 of the top 10 property and casualty insurers, 2 of the top 3 lodging companies, and 2 of the top 3 gaming companies (Acxiom, 2010). Acxiom’s use and analysis of customer data is central to serving these clients. Not only does it help them analyze the information they hold about their individual customers, it offers lots more individual information from a variety of public and private databases in order to help them discover the value of each person and the selling proposition that would be best for him or her.

A role the company emphasizes throughout its website involves helping a client decide which consumers are *not* worth targeting. This is called “contact suppression,” a practice based on making assessments about the “risk profile” of individuals for certain industries. Here is how Tom Mangan, the firm’s senior vice president of consulting services, described Acxiom’s contributions at a shareholders meeting (Acxiom, 2008):

Should I continue to target people who are in fact going to default on their loans? Or, take, for example, a telecom industry where they’re constantly flipping cell phones. I want to understand those characteristics and to say, is that a customer I really want to target? [...] Once we have that fundamental building block in place now, we can then enhance that with external information that we keep in our knowledge bases about every purchasing consumer across the country. And we can then use that to now start doing strategic segmentation, so we can break your customer base into each one of those strategic segments, from high value to low value.

The facts and generalizations that Acxiom imputes to individuals have the potential to travel broadly, as they are used by clients in different industries, for different advertising campaigns and pricing offers, across different analog and digital media. Many other firms gather online and offline data about individuals, often with the help of publishers who sell data about their audiences. The data firms aggregate this information about individuals into digital cookies and license their use to marketers. For example:

- **eXelate** is a leading targeting exchange firm with the motto “MAKING BIG DATA WORK FOR ONLINE ADVERTISERS” (eXelate, 2012). It determines a

consumer's age, sex, ethnicity, marital status, and profession by partnering with websites to scour website registration data. It also tracks consumer activities online to note, for example, which consumers are in the market to buy a car or are fitness buffs, on the basis of their Internet searches and of the sites they frequent. It sells these packages of information about individuals as cookie data, so advertisers can target them.

- **Rapleaf** is a firm claiming to help marketers "customize your customers' experience." To do that, it gleans data from individual users of blogs, Internet forums, and social networks such as Facebook and Twitter. It uses ad exchanges to sell the ability to reach those individual cookies. The company says that it has "data on 900+ million records, 400+ million consumers, [and] 52+ billion friend connections" (Rapleaf, 2010).
- **33across** analyzes people's comments, activities, backgrounds, and connections on social networks in order to pull out those who fit profiles that advertisers want to reach. The firm finds people who directly fit all the advertisers' criteria. It also carries out statistical analyses of those people and of the firms' customers, to find "lookalikes" who would seem to be good prospects. In addition, 33across offers its clients "high degree interest" connections. These are individuals who are attractive because they are friends or friends of friends of active shoppers (and so might already be influenced) and have many friends themselves (so they may influence others). People who fall into different attractive profiles would see different campaigns with potentially different products and offers.
- **Lotame**'s deals with a "multitude of social networks" and other publisher sites lead it to collect "over 240 billion monthly [...] interests, actions and attributes" in order to "create precise audiences and derive insights from our superior knowledge of human behavior" (Lotame, 2010). For the individuals it comes across with, the firm monitors and stores information about demographics (age, gender, geography, household income, and education level), interests (declared to the site and undeclared), actions (what people create, rate, send, share, upload, comment, edit, watch, "and more"), media use (online – which can include videos, widgets, music, forums, blogs, and photos), recency and frequency (how often and when individuals express interests and/or actions), interactions (how people interact with content and ads, including clicks, time spent, and videos completed), and sentiment and exposure (what individuals say, what they read, when and how they say and read it). This interrogation of people's creative activities in the digital realm leads the company to interact with particular individuals in a way that is "based on what they talk about, the sentiment they've expressed in discussions, or the content or conversations they've read or participated in." It also leads Lotame to tailor display ads and commercials for the targeted individuals. In turn, the firm monitors the results and adds its analysis to the data, in order to further "learn what demographics, interests, attributes, and actions drive a campaign's success based on goals" (Lotame, 2010). This process continues with new data, new people, and new advertisers.

(3) *In tune with the personalization in advertising, publishers are beginning to personalize editorial matter based on profiles they create and profiles they can purchase.* One incentive publishers have for personalization is to make their material stand out to advertisers, at a time when media buyers think less of the place where they are posting the ad than of their ability to purchase impressions of the right type of individual – or even of the exact individual – wherever that person shows up in the digital universe. Publishing executives reason that, if they serve tailored content to visitors, then people will stay longer, view more commercial messages, and even be prompted to click on more ads, because of the relevance that both ads and editorial matter combine to create, increasingly in real time. Edwin Wong, director of market research for Yahoo Search, suggested another reason for content personalization in an interview. He said it allows the media firms and their advertisers to learn increasing amounts about individuals' interests and their responses to those interests. That, in turn, could inform the creation of profiles that advertisers would use to encourage clicks and other engagements (Wong, 2010).

Despite media buyers' enthusiasm for tailored editorial matter, a number of logjams have hindered its implementation. Executives from major news companies said in interviews that until recently their firms have been loath to personalize their presentations for audiences, in a long-held belief that the best content "is based on serendipity," as a Time Inc executive put it. He also suggested a worry that personalization could harm the company by startling people about the knowledge firms have about them. "If I saw that the magazine editor said, 'Kirk, we know you're in debt up to your eyeballs. Here are articles that can help you,' I might well freak out" (McDonald, 2010).

As competition heats up, however, that belief is changing. Time Inc and other firms are searching for ways to justify the quiet customization of news on the basis of their generalizations about a person's interests and background. In the meantime, smaller firms have already started experimenting. A firm called The Daily Me personalizes news and sports presentations on the online sites of more than a dozen newspapers. Gerald Hauser, its founder and CEO, presented an actual example: a *Boston Globe* reader visits the *Dallas Morning News* site because of an article noted on a blog or search engine. Both the *Globe* and *Morning News* are Daily Me clients, and so its cookie notes the anonymous individual at the *Morning News* site. Because The Daily Me's cookie contains the information that the person read a lot about soccer on the *Globe* sports section, it tells the *Dallas Morning News* to serve him soccer stories. Moreover, when an ad is served along with the story, its text and photos are arranged instantly to include soccer terminology and photos as part of the advertising pitch. A basketball fan receiving an ad for the same product will get language and photos that call out to people with hoop interests (Hauser, 2011).

While it seems likely that text- and photo-based personalization will develop quickly now that it has strong publisher rationale and advertiser support, personalized audiovisual content is likely to be harder to implement because of cost. It is already

possible today to change aspects of television programming and games on the basis of social backgrounds. Visible World can change the look of characters and products in programs on the fly, according to data in a household's set-top box. Knowledgeable observers note, however, that the cost of carrying out even these basic personalization activities on television in the near future will be too steep for advertisers to support them. In-game personalization of this sort – based on demographic and behavioral conclusions about the player – is also a technical possibility (it already exists with ads), but it is still not a major talking point among producers or marketers. Much more likely is the presence, in the next few years, of an “intelligent navigator” keyed to the characteristics of the person or household. An intelligent navigator is a guide that will appear on a person's television set when it connects to the vast viewing lode offered from Internet programming. This so-called Internet-protocol television (IPTV) will allow the reception of thousands of individual shows at any time. The flood of options will encourage software that suggests a priority of possibilities for a household or for particular individuals in the household.

A major attraction for a “navigator” firm will be the opportunity to make money from commercials at the side of the listings. The navigation firm will likely charge substantially for marketers to plug into the profiles it develops about individuals on the basis of their viewing of programs and commercials. Advertisers will also pay a premium to intelligent-navigator firms to serve interactive ads to big-screen home television sets on the basis of the knowledge of individuals that the advertisers gathered on other websites, and perhaps in stores. A partnership between Visible World and Interpublic's Cadreon advertising exchange seems to be preparing for just this scenario. In 2010 Cadreon tracked and identified web users who appeared to be researching new car purchases on the web. It then used Visible World's personalization platform on cable TV systems to place appropriate commercials in front of those same individuals. Cadreon's goal, as it moves forward, is to increase the ability to personalize commercials on the strength of inferences made from more and more data. CEO Brendan Moorcroft told *AdWeek* that Visible World “brings an infrastructure for ad serving to TV not unlike what Atlas or DoubleClick do” for the Internet. “It allows us to apply intelligence for TV buying like you do for the Internet.” And if it were unclear to observers that people's reputations behind the screen would be the drivers of commercial messages, he added: “For the first time you'll see real scale [in the targeted space] with hundreds of ads seen by millions of people, all determined by algorithms and data as opposed to human instinct” (McClellan, 2010).

The Long Click, Reputation, and Audience Power

The Cadreon case is an example of the way in which targeting and personalization technologies developed for the World Wide Web are migrating to other media arenas. Brick and mortar retailers are beginning to build digital media into the very

heart of their sales activities. Supermarkets are involved in various experiments in which knowledge of the shopper's identity (via a frequent-shopper card, for example) activates a "smart" shopping cart, which displays discounts and ads that are based upon profiles of the person's shopping history (see, e.g., Turow, 2006). Location-aware applications built in people's mobile devices are encouraging a different sort of profiling, this time in the interest of presenting individuals with discounts or other prizes for visiting nearby restaurants or other stores (Clifford, 2010).

Because of the industry thinking that enshrines the long click as an ideal measure of success, the link connecting the traditionally offline and online, as well as the domestic, the outdoor, and the in-store is becoming a reality. Already research firms such as comScore and Nielsen are using their huge panels to track the impact of a person's encounter with an online ad on that person's purchase activities. They sell to marketers data about the types of people who are likely to complete the long click. Some firms are forgoing this statistical analysis in order to trace all the individuals who come into contact with them. A major auto manufacturer has developed tools to track the ways particular interactions with its ads lead to particular ways those people interact with the firm's sites and, in turn, predict whether they come into the dealership and with what result. The predictive profiles associated with different individuals affect the ways the auto company interacts with them online and in the brick and mortar store.²

When stories such as these make it into the public eye, the discourse inevitably turns on their implications for privacy. Advocacy organizations, members of Congress, editorial writers, and members of the public have excoriated companies that track behavior in ways that are not transparent. Social battles around the meaning of *personal*, the helpfulness of privacy policies and icons, the utility of *opt-in* and *opt-out* choices, and the value of transparency versus regulation take up much of the discourse. Almost ignored in the literature are the implications of tracking and personalization for the different views of the world that individuals receive from marketers and from the publisher. The process of tailoring content has begun only recently, but it is growing quickly. As the preceding pages suggest, tailored advertising and discount coupons have taken the lead, but the lessons from that are now starting to be applied to information, news, and entertainment as well. Moreover, these personalized engines of content may well spread, with their personalized profiles, across digital devices and domestic, outdoor, and in-store venues. The upshot: people may well be surrounded by a symbolic environment created from categories about them that a wide range of marketers and publishers share but about which the individuals constructed through those data have no knowledge.

In considering the future of digital targeting, it is useful to draw a distinction between profiles and reputations. Profiles are descriptions of individuals that lack comparative rankings of desirability. Marketers and publishers then map *their* sense of attraction to them. If, for example, marketers want 18–24-year-old women who like vampire movies, they will consider profiles of women aged 35–50 unattractive. Nothing in the information about the 35–50-year-old women, however, makes them

inherently unattractive. As the Next Jump and auto-dealer examples suggest, though, a next logical step in digital marketing is to build comparative evaluations of individuals into clusters of descriptions that are based on actions such as their statistical record of spending money, of giving back a product, and of telling friends about products. With such an approach, profiles become reputations. That is, they become clusters of data that have, built into them, a sense of the comparative utility of individuals to marketers (and, by extension, to media firms) along a range of commercially driven dimensions and contexts.

The movement of the advertising industry from profiles to reputations seems clear in the media-buying system's logic, as this is expressed through executives' discussions, their companies' behaviors, and the personalization technologies that are emerging. The concern here is not with whether the evaluation, separation, and trading of individuals in an iterative way actually increases the advertisers' bottom line. It is with the impact of the advertisers' patronage demands and with the technologies through which they are expressed to audiences and in the media in the twenty-first century. One consequence of media buying is that data firms and marketing agencies have learned to use the creative activities of independent bloggers and of social-media participants in order to concoct marketing categories for the purposes of social discrimination. Ironically, what writers correctly extol as examples of individual initiatives are also a part of the efforts through which the digital media system is preparing to present different people with different opportunities and world views across a broad gamut of platforms. David Croteau pointed out in 2006 that we know little about the impact of user-generated content on the new media landscape (Croteau, 2006, p. 340). To this observation it should be added that we know little – and we theorize little – about the impact of the institutional forces surreptitiously shaping the landscapes on which user-generated activities take place. How, when, and with what impact do the two layers of the digital world interconnect? It is a question that warrants systematic research.

Early twentieth-century sociologists from the Chicago School would undoubtedly see the market-driven social discriminations of the contemporary advertising industry as derailing their belief that media can encourage greater opportunities for democratic argumentation across broad populations. Dewey, Cooley, and Park might find some hope in the observation that the breadth, depth, nature, and consistency of the discriminatory processes will depend to some extent on the resistance that marketers and publishers perceive from advocacy organizations, legislators, and citizens. Unfortunately, public and academic discussions about the long-term implications of advertisers' new approaches to audiences are hard to find. For members of the Chicago School, democratic discussion about such critical topics that define society would best be based on universal education and access to information. One reason is that the media-buying system is difficult for outsiders to understand and its activities are largely and quite purposefully hidden from view. Nevertheless, because the interconnections of media buying, digital-content production, and audience construction raise major social issues at the core of the twenty-first

century's central media system, this is a topic that academics should help pull into the spotlight.

NOTES

- 1 Without evidence, a Wikipedia entry notes that the website Global Network Navigator (GNN) sold the first clickable web ad – later called a banner – on its home page in 1993 to a law firm with a Silicon Valley office. It claims that the Hotwired site was the first to sell clickable ads in large quantities. See “Web Banner,” Wikipedia (English edition), accessed January 31, 2010.
